The Builder

THE J. PAUL GETTY MUSEUM LIBRARY

The Builder

AN

ILLUSTRATED WEEKLY MAGAZINE,

FOR THE

Architect, Engineer, Archæologist, Constructor, & Art-Lover,

CONDUCTED BY

GEORGE GODWIN, F.R.S., F.S.A.

Honorary Member of various Societies; Author of "History in Ruins," "Town Swamps and Social Bridges," "Another Blow for Life," &c.

"Every man's proper mansion-house, and home, being the theater of his hospitality, the seate of selfe-fruition, the comfortablest part of his own life, the noblest of his sonne's inheritance, a kinde of private princedome, nay, to the possessors thereof, an epitome of the whole world, may well deserve, by these attributes, according to the degree of the master, to be decently and delightfully adorned."

"Architecture can want no commendation, where there are noble men, or noble mindes."——SIR HENRY WOTTON.

"Our English word TO BUILD is the Anglo-Saxon Býldan, to confirm, to establish, to make firm and sure and fast, to consolidate, to strengthen; and is applicable to all other things as well as to dwelling-places."——DIVERSIONS OF PURLEY.

"Art shows us man as he can by no other means be made known. Art gives us 'nobler loves and nobler cares,'—furnishing objects by the contemplation of which we are taught and exalted,—and so are ultimately led to seek beauty in its highest form, which is GOODNESS."

VOLUME FOR 1864

LONDON:

PUBLISHING OFFICE, YORK STREET, COVENT GARDEN, W.C.

COX AND WYMAN,

J. TURNER, Hon. Secretary, 15, Wilton street.

MUSEUM, SCHOOL of ART, and FREE LIBRARY, AT EXETER (AN ALBERT MEMORIAL).—TO ARCHITECTS.—The Committee of the above Institution are desirous of receiving DESIGNS, comprising Plans Elevations, and Sections of the proposed BUILDING, which must be sent to the undersigned on or before the 1st day of MARCH next. A premium of £50 will be given for the most approved design, and £30 for that considered by the Committee to be next in merit. If the author of the best design should be employed to superintend the erection of the building or such portion of it as may be determined to be built in the first instance, he will be paid the usual commission on the cost of the works in lieu of the premium. A block plan of the site, together with particulars of the accommodation required, may be obtained by application to us,
WINSLOW JONES, } Hon. Secretaries.
CHARLES WESCOMB, }
Exeter, December, 1863.

EVENING LECTURES, at the ROYAL SCHOOL of MINES, JERMYN STREET.—PROFESSOR RAMSAY, F.R.S. will commence a COURSE of TEN LECTURES, on STRATIGRAPHICAL GEOLOGY, on TUESDAY, the 12th of JANUARY, at EIGHT o'clock, to be continued on each succeeding FRIDAY and TUESDAY EVENINGS, at the same hour.—Fee for the whole Course, prepaid, £2; at the Museum of Practical Geology, £3.

The SECOND COURSE of SIX LECTURES on METALS by Dr. PERCY, F.R.S. will be COMMENCED on MONDAY, the 11th JANUARY, at EIGHT o'clock.—Tickets may be obtained, by Working Men only, on MONDAY, 4th JANUARY, from TEN to FOUR o'clock, upon payment of a fee of 6d. for the whole Course. Each Applicant is requested to bring his name, address, and occupation written on a piece of paper, for which the Ticket will be exchanged. Written applications cannot be attended to.
TRENHAM REEKS, Registrar

BILLING'S PATENTS.—CHIMNEY TERMINALS.—THROAT VALVES.—NOTICE to ARCHITECTS. The Proprietors of these PATENTS have given the Writer an interest in the same, and have considering refused the use of the Articles, trusting that by so doing these useful Inventions may be introduced more generally in all new buildings.—For prices, apply to the Manager, Mr. TYLER, 12, Abingdon street, Westminster, who will also afford any information, he having been for many years engaged with the late Mr. BILLING, in the practical curing of Smoky Chimneys.

BY ORDER of the SECRETARY of STATE for INDIA in COUNCIL.
Notice is hereby given, that TWENTY-FIVE APPOINTMENTS in the UPPER CLASS of the ELECTRIC TELEGRAPH DEPARTMENT in India will, in the year 1864, be open to PUBLIC COMPETITION.
A Competitive Examination will, accordingly be held in this office in the month of MAY next. Full printed particulars of the conditions on which candidates will be admitted to the Examination, and also respecting the nature of the Appointments to be competed for, may be obtained at this Office, on application, either personally or by letter, addressed to the "Under Secretary of State for India," India Office, London, S.W.
November 20th, 1863.

THE ARCHITECTURAL MUSEUM, SOUTH KENSINGTON MUSEUM, W.
PRIZES FOR COLOURED DECORATION.
£5, £3, and £2 are now offered. The Competition will be open till MARCH 1st, 1864. Casts for coloured decoration, prices, and full particulars may be had by letter to the Honorary Secretary, at 13, Stratford-place, W.
A. J. B. BERESFORD HOPE, President.
GEO. GILBERT SCOTT, Treasurer.
JOSEPH CLARKE, Hon. Sec.
All requests for Casts for Coloration must be accompanied by a Post-office Order on Charing-cross for 5s.; or if cast and packing required, 7s.

NOTICE.
BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 73—74, Bishopsgate-street Within, a few doors from the late Arcade, at No. 42. These afford an Exhibition for a full large stock of their Patent Prize Medal Ranges and Stoves, Register Gates, and Cooking Utensils, to meet the great public demand; and also for the consequent more extensive execution by the manufacturers themselves, of all descriptions of hot water, bath, laundry, and steam work.
73—74, Bishopsgate-street Within, November, 1863.

CHATHAM HOUSE COLLEGE SCHOOL, Ramsgate. The TERM for 1864 will commence JANUARY 20th. A Prospectus of Terms (which are moderate) and further information may be obtained of the Rev. the PRINCIPAL. Four Boys from this School passed the Senior Oxford Local Examination in June last, all of them in Honours.

COMPETITIONS.

THE Committee of the Aldershot Institution for Mental Improvement and Social Recreation, are prepared to receive PLANS for the ERECTION of their new PREMISES, the cost of which is not to exceed £800. The Architect's fee to be 5 per cent. upon the outlay, including all extras.—Further particulars, with drawings of the proposed site, will be forwarded, post free, on application to the Honorary Secretary. The plans to be deposited at the Institution not later than the 2nd FEBRUARY, 1864.—The Committee reserve to themselves the power of rejecting the whole of the Plans.

CONTRACTS.

WAR DEPARTMENT CONTRACT.—NOTICE to BUILDERS.—TENDERS are required for ERECTING a READING-ROOM, &c. at the New Barracks, Gosport.
Parties desiring to Tender for the erection of these Works must leave their names at the Royal Engineer's Office, Gosport, on or before the 11th day of JANUARY, 18[illegible], and pay the sum of Ten Shillings in Exchange for the Bills of Quantities, which will be forwarded to each party as soon as prepared, at the Government Contract Price.
The Secretary of State does not bind himself to accept the lowest or any Tender.
Royal Engineer Office, Portsmouth, 23rd December, 1863.

COAST GUARD CONTRACT.—NOTICE to BUILDERS and CONTRACTORS
Persons desirous of TENDERING for the ERECTION of a COAST GUARD STATION at Flesterton, in the county of Lancashire, may inspect the Drawings and Specifications at the Coast Guard Watch room, Fleetwood, or at this Office, between the hours of TEN and FOUR, from MONDAY, the 21st day of DECEMBER, to MONDAY, the 4th day of JANUARY, 1864 (now next ensuing, and both inclusive (Sundays and Christmas-day excepted).
Tenders to be sent to this Office not later than TWELVE o'clock at noon of the 5th day of JANUARY, under seal and directed to the Commodore Controller General of Coast-Guard, and endorsed "Tender for Erection Coast Guard Station."
The Lords Commissioners of the Admiralty do not pledge them selves to accept the lowest or other Tenders.
Dated this 30th day of December, 1863, at the Admiralty,
Coast Guard Office, 19, Spring Gardens, London, S.W.

TO BUILDERS and OTHERS.—The Commissioners of Sewers of the City of London will meet in the Guildhall of the said City, on TUESDAY, the 19th of JANUARY next, at Half-past TWELVE o'clock precisely, to receive TENDERS for the CONSTRUCTION of NEW SEWERS, and Works connected therewith, in Nowell-court (better known as Jewin-court), and in a portion of Jewin-street, specially required and pointed out to be seen at the Office of the Engineer. The said Contract is for the total sum. Security will be required from the Contractor for the due execution of his Contract. The Commissioners do not pledge themselves to accept the lowest Tender, or any, unless certain advantages, and no Tender will be received after TWELVE o'clock on the day of treaty.
JOSEPH DAW, Principal Clerk.
Sewers Office, Guildhall, 17th December, 1863.

TO BUILDERS.—TENDERS are required for the ERECTION of VILLAS at Twickenham Plans and Specifications to be seen on and after FRIDAY, 1st JANUARY, 1864, at the Office of the Architect, Mr. W. PAICE, 11, Great James-street, Bedford-row, W.C.

CONTRACTS.

VESTRY of ST. MARY, NEWINGTON, SURREY.—To BUILDERS and OTHERS.—The Vestry is desirous to have ERECTED a VESTRY-HALL and OFFICES, in the Walworth-road, Newington, Surrey, and to receive TENDERS for that purpose. Persons intending to tender must first inform themselves, at the Vestry Hall, Newington, Surrey, between the hours of TEN and FOUR o'clock, on the evening preceding the day of delivering their tenders, as below, the exact nature of the proposed Contract, for which alone they will be required to tender.
Tenders are to be delivered at the Vestry-room, St. Mary's Church, Newington, on TUESDAY, 12th JANUARY next, at SEVEN o'clock in the evening precisely, and not before, or they will not be considered.
Plans and Specifications are to be delivered at the Vestry Hall, Walworth-road, on Friday, the 8th JANUARY, 1864, at TEN o'clock in the forenoon precisely, when and where all Tenders approved of in all particulars, and no other, will be received for the performance of the said Contract.
R. A. WILDES, Clerk of the Peace.
Maidstone, December 17th, 1863.

TO DUSTMEN, BRICKMAKERS, and SCAVENGERS.—The Crown Estate Paving Commissioners hereby give notice, that they are ready to receive PROPOSALS from persons willing to enter into a CONTRACT for the REMOVAL of DUST, BRICK, ASHES, and CINDERS, from the houses within the district under their jurisdiction in that respect for a period of one year, from the 29th day of JANUARY, 1864. Copies of the conditions of Tender can be obtained upon application to me here. The Tenders, sealed and addressed to the Crown Estate Paving Commissioners, and entitled "Tender for Dust," to be delivered at my office before THREE o'clock on WEDNESDAY, the 6th day of JANUARY, 1864.
FRANCIS ADAMS, Clerk to the Commissioners.
1, Whitehall place, December 22nd, 1863.

TO BUILDERS.—WESTGATE CHAPEL, Heckmondwike.—TENDERS are required for the whole or any part of the WORKS now REBUILDING of the CHAPEL now known as the "Lower Chapel," Heckmondwike. Drawings, specification, and conditions of Contract may be seen at the Vestry of the present Chapel from MONDAY, the 11th of JANUARY next, to the SATURDAY following, both inclusive. And separate sets may be obtained, without charge, after MONDAY, the 11th of JANUARY, upon application at our Offices in Bridge-st, Batley. Sealed Tenders to be delivered at Mr. HANNAH SYKES, 17, Cheapside, not later than ELEVEN a.m. on MONDAY, the 18th of JANUARY. The Committee will not be bound to accept the lowest or any Tender.
PAULL & AYLIFFE, Architects.
India Buildings, 24, Cross-street, Manchester.
Dated this December, 1863.

TO BUILDERS and OTHERS.—Persons willing to submit TENDERS for BUILDING a new RECTORY-HOUSE and OFFICES at Elmswell, Suffolk, on a site about half a mile from the Elmswell Station, on the Ipswich and Bury Railway, to be built to the plans and specification of the undersigned, to be seen at the Rectory, at Elmswell, from MONDAY, the 11th JANUARY, to SATURDAY, the 23rd inclusive. Tenders, sealed and endorsed "Tenders for Rectory," to be delivered at the Rectory on or before the 28th of JANUARY, addressed to the Architect, Mr. R. J. WITHERS, 23, Dunghy street, London, W.C., and from whom the Builder publishes may be obtained. The lowest or any Tender will not necessarily be accepted.
W. H. CLARKE, Rector.
Elmswell Rectory, Woolpit, Suffolk, December 26, 1863.

TO BOILER MAKERS and ENGINEERS.—SAINT PANCRAS, Middlesex.—The House Committee of the Directors of the Poor of this Parish are willing to receive TENDERS for the supply of a LARGE BOILER, at the Workhouse, Kentish Town-road, according to the plan and specification of Messrs. Bramwell, Mr. WARD, wardmaster of the Workhouse, will show the premises and Boiler to intending Tenderers. Tenders must be delivered at the Workhouse, and be endorsed "Tender for Boiler," and addressed to me at the Vestry Offices, Pancras-road, on or before TWELVE o'clock on THURSDAY next. The Committee and Directors do not bind themselves to accept the lowest or any Tender.
THOMAS PLAW, Clerk.
Vestry Offices, King's Road, St. Pancras,
28th December, 1863.

LANCASHIRE and YORKSHIRE RAILWAY.—The Directors are prepared to receive TENDERS for the CONSTRUCTION of a BRANCH RAILWAY from Lockwood to Meltham, near Huddersfield. Lengths and sizes of Bridges and specification may be seen at the Books of Tenders ready for the Engineer's Office, Hunt's Bank, Manchester, on and after MONDAY, the 4th JANUARY proximo, and Tenders, properly endorsed and addressed to the Directors, must be with the Secretary not later than MONDAY, the 18th FEBRUARY, 1864.
Manchester, December 24, 1863. WM. S. LAWN, Secretary.

[For remainder of Contracts see next Page.]

CONTRACTS.

TO IRONFOUNDERS. — The Gomersal Waterworks Company do not intend to let by TENDER or CONTRACT, the MAKING of about NINE MILES of CAST-IRON SOCKET PIPES—specifications for the same may be seen, and other information obtained, at my Office, from MONDAY, the 28th inst. to TUESDAY the 5th JANUARY, 1864. Sealed Tenders, endorsed "Tender for Water pipes," must be delivered, to me, at the Waterworks Office, in Gomersal, not later than SIX o'clock on the last-mentioned day. The Company do not bind themselves to accept the lowest or any Tender.

JOHN HART, Engineer to the Company.
32, Kirkgate, Bradford, December 21, 1863.

GRANGE HOTEL COMPANY LIMITED.—TO BUILDERS.—PERSONS desirous of TENDERING for the whole or any one of the WORKS required in the Erection of a FIRST-CLASS HOTEL at Grange, Morecambe Bay, can see the Plans and Specifications at the Office of Messrs. PAGE, Architect, Lancaster, from MONDAY DECEMBER 21st, until WEDNESDAY, 6th JANUARY 1864. Tenders to be sent in by seven o'clock, and not Tenders, Grange Hotel Co. to Mr. JAMES PAGE, on or before JANUARY 11th, 1864. The lowest or any Tender will not necessarily be accepted. By order of the Directors.

Lancaster, December 21st, 1863.

NORTHAMPTON NEW TOWN HALL. DRAWINGS and specifications for Part of the new Buildings for the New Hall, Assembly Rooms, by the Architect, G. W. Saul, Esq., may be seen at the Office of Messrs. Law, Newhall, Northampton. Persons willing to CONTRACT for MAKING and FURNISHING and FITTING the same, are invited to send Tenders to the Town Clerk's Office, addressed to the Borough Committee, on or before the 12th day of JANUARY, 1864.—By order,

JOHN JEFFERY, Town Clerk.
North ampton, 21st December, 1863.

TO BUILDERS and OTHERS.—CHELSEA WORKHOUSE.—Notice is hereby given, that TENDERS are required for the REBUILDING of the SOUTH-WEST WING of the WORKHOUSE.—The drawings, specifications, and Form of contract may be inspected, at the Office of Mr. Arthur Cottam, Surveyor, Chelsea, on the 9th, 10th, and 11th days of the present month, between the hours of TEN and FOUR o'clock. Sealed Tenders (endorsed "Tender for Alterations to Chelsea Workhouse") are to be addressed to the Board of Guardians of the Parish of Chelsea, and to be delivered at my Office, 10, Arthur street, Chelsea, before TEN o'clock in the forenoon, on THURSDAY, the 14th day of JANUARY next, and the Board will proceed to open the same at HALF-AN-HOUR o'clock, when parties tendering will be expected to attend. No Tender will be received after the time appointed. The Board do not bind themselves to accept the lowest or any Tender. And the party whose Tender shall be accepted will be required to provide two sufficient sureties in the sum of £600 for the due performance of the contract. The cost of preparing the contract and bond will be borne by the Guardians. By order,

W. L. DIGGENS, Clerk to the Guardians.
Chelsea, December 16, 1863.

TO BUILDERS. — Persons desirous of TENDERING for a NEW ROOF over the NAVE of the Parish Church of Hythe, in the county of Kent, are informed that the drawings and specifications may be seen by application to Mr. W. S. SMITH, the Vestry Clerk, at the Office of E. Wallis, Esq., Solicitor, at Hythe, the Architect, at Lewes, and after DECEMBER 30th. Tenders to be delivered at the Office of the Architect, EWAN CHRISTIAN, 8a, Whitehall place, London, on or before JANUARY 18th, 1864. The Committee not bind themselves to accept the lowest Tender, and a good and sufficient security will be required for the due performance of the work.

SALISBURY, POOLE, and DORSET JUNCTION RAILWAY.—To POST and RAIL FENCE CONTRACTORS.—Parties desirous of TENDERING for the FENCING on the above LINE of RAILWAY (56 miles in length) can see the specification at Mr. GARRETT'S Office, 20, Great George street, Westminster, after the 4th JANUARY; and will be invited to meet the Engineer at the TWO HILL Station, on WEDNESDAY, JANUARY the 13th.—The lowest or any Tender will not necessarily be accepted.

TO BUILDERS and OTHERS, desirous of TENDERING for ALTERATIONS, at No. 30, Lamb's Conduit-street for Lord Lieutenant Norfolk.—Messrs. Mathews have drawings and specification at the Premises, on and after MONDAY, JANUARY 4th, 1864. Tenders to be delivered at HERBERT DAY evening, JANUARY 14, 1864, at EIGHT o'clock. The Directors do not bind themselves to accept the lowest or any Tender.

Dated GEORGE WHEELER, Clerk of Clerk.

TO BUILDERS and OTHERS.—BUILDERS desirous of sending in TENDERS for the ERECTION of a NEW CENTRAL POLICE STATION, and OTHER BUILDINGS, in the MARKET PLACE, BATH, for the Corporation of Bath, can see the Drawings and Specifications of the same, with the plans of the several Wards, at the GUILDHALL, on or after MONDAY, 4th JANUARY. Tenders properly endorsed, addressed to the Town Clerk, to be delivered at the Guildhall, on or before THURSDAY, JANUARY 21st. The law of or any tender will not necessarily be accepted. CHARLES E. DAVIS, City Architect.

City Architect's Office, Bath, 21st December, 1863.

TO ENGINEERS, COPPERSMITHS, &c. — The Guardians of the Poor of the Whitechapel Union will meet in their Board Room, at the Workhouse, on TUESDAY the 12th day of JANUARY, 1864, at SIX o'CLOCK in the Afternoon, to receive TENDERS for supplying and fixing certain BOILERS and COOKING APPARATUS at their Industrial School, Forest-one, Stratford, Essex. The Specification and Plans may be inspected on application to the Master of the School at any time between the hours of Ten and Four. Tenders must be made upon the printed forms to be obtained of the Clerk, and the Guardians do not engage to accept the lowest or any Tender.

By ADAMS FARR, Clerk.
Clerk's Office, Warbouse, 28th December, 1863.

POLONCEAU and SEYSSEL ASPHALTE.

ESTABLISHED  1838

For covering Flat Roofs, Paths, and Flooring of every description especially adapted for Ships and Barges. Very little is now exposed to the Atmosphere, which has been the cause of public preference to asphalte in preserving its durability and beauty. Prices, &c., supplied by JOHN PEARSON, 17, Fleet street, Ludgate Hill, London, E.C.

Country Builders supplied with Asphalte in Bulk for covering Footways, Barn Floors, &c. with instructions for laying.

GUTTA-PERCHA MILL-BANDS.—The Gutta Percha Company beg to state that their Belts are manufactured of the purest Gutta Percha and India-rubber, and are carefully adapted to the strain they have to bear. They are found to be more durable and of greater strength, perfectly uniform in thickness, and not liable to stretch or become slack. They are not affected by any change of temperature, or by oil, acids, &c., to which they may be exposed in the mill, and are not injured by steam. They are not liable to crack, and are not affected by damp. They are not liable to crack, and are not affected by damp. They are not liable to crack, and are not affected by damp

ST. PANCRAS IRON WORK COMPANY,

OLD SAINT PANCRAS ROAD, LONDON, N.W.

APPROVAL OF THE ROYAL VETERINARY COLLEGE.

THE MEDALS OF ENGLAND AND FRANCE,

And the Medals and High Recommendation of the Royal Agricultural Societies of England and Ireland.

SECURED BY EIGHT SEPARATE PATENTS. LATEST, 1863.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick, or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, with RACK & WATER-TROUGH,

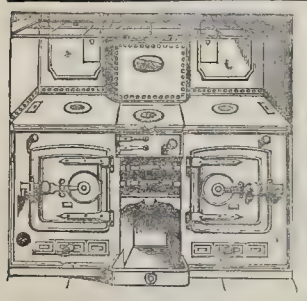
The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

THE HALTER BALL, ATTACHED BY A NEW IMPROVEMENT, WORKS NOISELESSLY, AND ALMOST WITHOUT FRICTION.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible; advantages peculiarly their own.

THE PATENT HARNESS FITTINGS



Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

EVERY DESCRIPTION OF STABLE FURNITURE.

ILLUSTRATED LISTS ON APPLICATION.——INSPECTION OF SHOW-ROOM REQUESTED.

Also Screw Water Valves, with gun metal faces.

BRYAN DONKIN & CO. ENGINEERS

Near Grange road, Bermondsey.

NOW OPEN, YOUNG'S IRONMONGERY WAREHOUSE,

No. 24, Dover-street, Three Doors from Oxford street.

For the supply of Builders, Carpenters, Upholsterers, Smiths, Bell-hangers, and the Trade in general, at wholesale prices. In connection with his Old Establishment, No. 18, Blandford-street, Manchester-square, running out of Baker-street, Portman-square, London, W.

SMOKY CHIMNEYS.

S. DEACON

Respectfully invites the attention of Architects, Builders, &c. to his

PATENT LOUVRE CHIMNEY CAP,

which has been in use some time with perfect success, in preventing chimneys whose other caps have been of no avail.

The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of its displacing, an increased up-current, and the impossibility of a down one.

Prospectus forwarded on receipt of Postage stamp, by

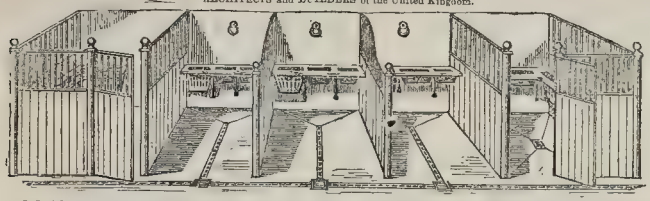
S. DEACON,

59, ALMA STREET, HOXTON, N.

MANUFACTORY:

HEMSWORTH STREET, SAINT JOHN'S ROAD, HOXTON, N.

A PRIZE MEDAL for SUPERIOR LOCKS was awarded to J. H. BOORBYER, at the Great Exhibition of 1851, who invites the attention of Builders, &c. to his Stock of Iron-mongery, Brass Founding, Nails (wrought and cut), Copper, and Zinc; Patent Locks of all descriptions; China, Glass, and Wood Furniture, of all kinds, with Patent Shifting Spindles; Dr. Arnott's Ventilators and all the New Registered Venetian Ventilator, so much admired, 6s. each.



J. H. BOORBYER late STURCH & BOORBYER), established nearly 20 years, for the supply of GOODS of the BEST MANUFACTURE, at the LOWEST PRICE.

14, Stanhope-street, Newcastle street, Strand, London, W.C.

BY APPOINTMENT TO H.R.H. THE PRINCE OF WALES.

BARTON'S PATENT PRIZE MEDAL STABLE FITTINGS.

These SUPERIOR-CLASS STABLE FITTINGS are PATRONIZED by the PRINCIPAL NOBILITY, and ADOPTED by many of the FIRST ARCHITECTS and BUILDERS of the United Kingdom.

J. BARTON solicits attention to the NEW STABLE just completed, with full size Stalls, Loose Boxes, and Harness-Room, now open for inspection, at the Manufactory, 370, Oxford-street, where an extensive assortment of all kinds of Stable Furniture, upon the most modern and improved principles, are to be seen.
A new Illustrated Catalogue, with numerous engravings of the improved method of fitting up Stables, forwarded on receipt of four stamps.

JAMES BARTON, IRON WORKS, 370, OXFORD STREET, LONDON, W.

EXHIBITION PRIZE MEDAL, 1862, AND MEDAL OF ROYAL AGRICULTURAL SOCIETIES OF ENGLAND AND IRELAND.

MUSGRAVE'S PATENT STABLE AND HARNESS FITTINGS.

MUSGRAVE'S PATENT HARMLESS LOOSE BOXES, MUSGRAVE'S PATENT IRON COW-STALLS AND PIGGERIES.

Architects who have not seen these Fittings are requested to write for Engravings, as they are unlike these of any other maker, and were admitted to excel all the work of their class in the Exhibition. They can be seen in first-class stables in almost every county in England; and MUSGRAVE, BROTHERS, are now fitting several very large establishments under directions of London Architects, noted for adopting only what is the best of its kind. Particulars of these, as well as of MUSGRAVE'S PATENT SLOW-COMBUSTION STOVE, will be forwarded on application to

MUSGRAVE, BROTHERS, ANN STREET IRON WORKS, BELFAST.

HOBBS, HART, & CO.'S

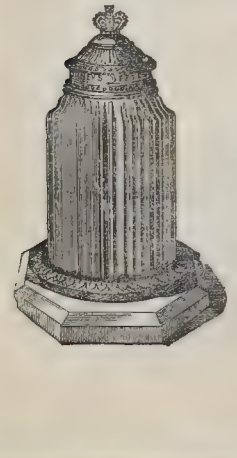
MACHINE-MADE LOCKS AND STREET-DOOR LATCHES.

These Locks are recommended for all purposes requiring good ordinary security combined with economy of price and durability of wear; as, by means of machinery, a faultless accuracy is arrived at which by hand-labour would be impossible except at a greatly increased cost.

The security of these Locks consists in a series of Levers that have to be raised to unequal positions by the bits of the key before the bolts can pass. These will bear comparison with those at treble their cost.

These Locks are made from two to five levers, and also in suits to differ, with master-keys to pass.

The retail prices for Cabinet purposes is from 2s. to 4s. each for Room Doors, 4s. to 9s. 6d. each; Street Door Latches, 7s. 6d. to 18s. each.



The 2-bolt 4-lever Mortise, with Hobbs & Co.'s Patent Follower, price 8s.

HOBBS, HART, & CO.'S PATENT PROTECTOR LOCKS.

200 Guineas were offered in the late Exhibition to any one who could Pick these Locks in thirty days. Their speciality consists in their combining the two essentials of security, viz.—protection against picking, by means of their Patent Moveable Lever Protector, and protection against illicit tampering with the Lock through the key-hole, and also tampering with the key, by means of their Patent Nozzle Protector. These all-important principles are the special and peculiar features of HOBBS, HART, & CO.'S Patent Locks. These Locks vary in price from 16s. to 50s. each, with solid keys. For prices with changeable keys, see 16-paged Illustrated List of Locks, Iron Door Safes, &c.

HOBBS, HART, & CO. 76, CHEAPSIDE, LONDON, E.C.

Manufactory—BRITANNIA FIELDS, WHARF ROAD, CITY ROAD, N.

THE LONDON

WARMING AND VENTILATING COMPANY

LIMITED,

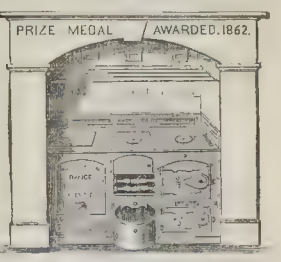
26, GREAT GEORGE-STREET, Westminster, S.W.

MANAGER, MR. WOODCOCK.

Churches, Greenhouses, Offices, and Buildings of every description warmed by means of a modification of the plans successfully used during the last five years by Mr. Goldsworthy Gurney in both Houses of Parliament.

Steam, Hot Water, Gas, and in open or enclosed fire-places, Coal and Coke, are equally available for the process.

The cost is less and the effect greater than that of any other known Plans.



The Horticulturalist will find herein an instrument of new and important powers.

The Apparatus may be seen in operation in ST. PAUL'S CATHEDRAL, the various offices of the "Department of Science and Art," and at the Architectural Societies' House, 9, Conduit-street, Regent-street

Particulars and testimonials forwarded on application.

PATENT WORCESTERSHIRE RANGE.

PRIZE MEDAL 1862, AWARDED FOR EXCELLENCE.

The above RANGE is most complete, and strongly recommended for its unrivalled ECONOMY, CLEANLINESS, CONVENIENCE, DURABILITY, and is a certain CURE for SMOKY CHIMNEYS.

It is an entirely new invention, and consists of large MEAT ROASTER, PASTRY OVEN, and WROUGHT IRON BOILER. The top forms a HOT PLATE for BOILING, STEWING, &c. The whole heated by ONE SMALL FIRE. One 5 feet wide is equal to an ordinary Range 8 feet wide.

Extracted from the "London Daily Telegraph," May 19th, 1862.

"INTERNATIONAL EXHIBITION, CLASS 31.

"Of the most recent inventions it should be said that Messrs. JONES & ROWE'S Patent Worcestershire Range has attracted very special attention, and has been commended by the highest authorities. A valuable peculiarity of their Ranges is the placing of the OVEN and ROASTER one above the other instead of *side by side*; and the ROASTER is constantly replenished with fresh air."

Nail Manufacturer and General Factor, BIRMINGHAM,
and 10, Gresham-street London, E.C.

HENRY DOULTON AND CO.'S

PATENT COMBINED SMOKE AND AIR FLUES.

BY THIS INVENTION PERFECT DRAUGHT AND COMPLETE VENTILATION CAN BE SECURED.

The air-flue follows the line of the smoke-flue, the passages being quite distinct. The heat from the smoke-flue causes a current, which carries off the vitiated air admitted by junctions near the ceiling. The pipes or blocks are *all made to bond with ordinary brickwork.*

Where the blocks come together, each air-flue has a lip or projection, which enters the next block and completely shuts off the air-flue from the smoke-flue at the joint. This lip, with dowels at the opposite corners of the blocks, also holds the lengths firmly together.

Curves are made to suit any inclination.

Manufactured in terra cotta for smoke-flues equal to 12 in 10 in. and 8 in. diameter, with ventilating-flues of proportionate size.

Small models will be forwarded to architects on application to

TO IRONMONGERS AND THE TRADE GENERALLY.

D. HULETT & CO. Manufacturers of GAS CHANDELIERS, HALL LANTERNS, GLASS LUSTRES, &c. &c. A large assortment of the newest designs always on show, every article marked in plain figures. Patentees, and Manufacturers of the Mercurial Gas Regulator. Complete Pattern-book and Price-lists 12s.—Nos. 55 and 56 High Holborn.

THE INTERNATIONAL EXHIBITION PRIZE MEDAL, AWARDED 1862.

ESTABLISHED 1744.

AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES.

To BUILDERS, CARPENTERS, and BLIND MAKERS.

J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his

IMPERIAL PATENT FLAX SASH-LINES,

of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

GARDNER'S SUNLIGHT GAS BURNER and FITTING ESTIMATES

offer important advantages to Architects, Builders, and the Public generally.—GARDNERS, No. 455, Strand, Charing-cross, four doors from Trafalgar-square, London.

ESTABLISHED 1752.

DESACHY'S FIBROUS PLASTER.
GEORGE JACKSON & SONS,
HAVING BECOME THE PROPRIETORS OF THE PATENT RIGHTS IN
DESACHY'S FIBROUS PLASTER,
Beg to call the attention of Architects to its Capabilities.
It is adapted for the speedy and economical production of any coffered or circular work, waggon-headed ceilings (all bracketing being avoided, as it is fixed to the joists direct), fluted and plain columns, panelled dados, all kinds of diaper, &c.; for the linings of walls and ceilings, and for all purposes of ornamental plaster.
The advantages are great. It is of great lightness and of excellent quality; it is not inflammable, and is ready to be painted immediately after it is made; it has been used under the direction of Owen Jones, esq., for the ceiling of St. James's Hall; at Messrs. Osler's, Oxford-street; Mr. Hancock's, New Bond-street; the Crystal Palace Bazaar; the Home for the Aged, South Lambeth; and at various other Works.
SPECIMENS CAN BE SEEN AT 49, RATHBONE PLACE.
DESIGNS MADE FOR ANY WORKS.
LITHOGRAPHED DESIGNS OF CEILING FLOWERS, &c. SENT FREE ON APPLICATION.

W. WILLETT'S SHOW-ROOMS, MARYLEBONE ROAD,

OPPOSITE THE YORKSHIRE STINGO,

A LARGE ASSORTMENT of STATUARY and COLOURED MARBLE, also ENAMELLED SLATE and STONE CHIMNEYPIECES, at Prices to command their Orders.

CARVED TRUSS STATUARY MARBLE CHIMNEYPIECE, 14-in. PIERS, FOR £6.

VIEILLE MONTAGNE ZINC.

THE ITALIAN-FORMED ZINC is much approved of by Architects and Engineers on account of its strength, durability, and appearance. On account of the light framing required, roofs, including framework and fixing, can be covered with it FOR £3 PER SQUARE up to 25 feet span. Sheds of larger span, including posts, 4*l.* per square. Architects are cautioned against allowing anything thinner than No. 13 gauge (20 oz.) to be used. ALL PLATES SHOULD BE REJECTED NOT BEARING, in addition to the Company's name, the words "ROOFING ZINC," and the gauge.

OLD ZINC RETAKEN AT HALF THE MARKET PRICE OF NEW.

For Designs and Estimates for Roofs, with Timber or Iron Framework, IRON CHURCHES COVERED WITH ZINC, and Buildings for the Colonies, apply to

THE COMPANY'S SURVEYOR,
12, MANCHESTER BUILDINGS, WESTMINSTER, S.W.

JAMES W. TYLER, CONTRACTOR FOR DEVAUX'S VIEILLE MONTAGNE THICK ZINC ROOFING,

ON IMPROVED PRINCIPLES.

12, ABINGDON STREET, and 4, WOOD STREET, WESTMINSTER, close to Victoria Tower.

Estimates formulated for every description of Zinc Roofing and Guttering, inclusive or exclusive of Timber or Iron Framework, in all parts of England.

Having for several Years been actively employed in laying DEVAUX'S THICK ROOFING ZINC (the purest extant) upon the new principles introduced by Mr. Edmeston, Mr. TYLER can refer with confidence to works of the most extensive and first-rate character.

Good Zinc badly laid will still be a failure, for there is much more importance in the mode of laying than is yet generally known; and parties who will intrust their work to Mr. TYLER will find that this important point is thoroughly attended to, and at no extra cost.

This Zinc thus laid is quite as lasting as lead, if the woodwork is arranged according to Mr TYLER'S directions.

This day is published, to be continued weekly.

THE TELEGRAPHIC JOURNAL, and Weekly Record of Electrical Progress. Price 4d.
TRUSCOTT, SON, & SIMMONS, Buffolk-lane, Cannon street, City.

KELLY'S PRACTICAL BUILDERS' PRICE BOOK; or, safe Guide to the Valuation of all kinds of Artificers' Work, with the Modern Practice of Measuring, and an Abstract of the New Building Act for regulating the Construction of Buildings. Revised and corrected by New Calculations upon the present Value of Materials and Labour. Arranged for an Architect of extensive, massive, Carpenter, Joiner, Plumber, Mason, Slater, Plasterer, Bricklayer, and Paviour. By WILLIAM KELLY, Practical Surveyor and Measurer. Illustrated by numerous Woodcuts, Royal 8vo, price nearly 20s bds.
London: published by T. KELLY, Paternoster-row; SIMPKIN and MARSHALL; and may be had of all Booksellers.

Of whom may be had, New Editions, just published, of the following Practical Architectural Works:—

1. PETER NICHOLSON'S PRACTICAL CARPENTRY, JOINERY, and CABINET MAKING, Revised by TREDGOLD: being a new and complete System of Lines, for the Use of Workmen; founded on Geometrical and Mechanical Principles. Ten parts at 3s. or 10 Parts, 4to; containing upwards of 120 Steel Plates, and numerous Woodcut Diagrams.

2. PETER NICHOLSON'S PRACTICAL MASONRY, BRICKLAYING, & PLASTERING (revised by TREDGOLD), both plain and ornamental; containing a new and complete System of Lines for Stone Cutting, for the Use of Workmen; the Formation of Mortars, Cements, Concrete, to which is added a variety of new designs for Mouldings, Ionic, Grecian Orders for Cornices, &c. &c.; and a description of the various materials employed. Ten Parts at 3s. or in boards, 4to; containing upwards of Ninety Steel Plates and Numerous Woodcuts.

3. TREDGOLD and NICHOLSON'S Theoretical and Practical Treatise on the FIVE ORDERS of ARCHITECTURE; containing plain and complete Rules for Drawing and Executing them in the correct style; including an Abstract of the Principles of Gothic Architecture. Illustrated by upwards of One Hundred Steel Engravings, executed by Artists of first-rate talent, including numerous Diagrams, &c. Twelve parts at 3s.; or in boards, 36s.

4. DESIGNS for COTTAGE and VILLA ARCHITECTURE: containing Plans, Elevations, Sections, Perspective Views and Details of Churches, Chapels, Schools, Almshouses, Gas Works, Markets, and other buildings for public purposes. By S. H. BROOKS, Architect. Beautifully engraved on steel, with Directions for Building, and the estimated Cost of each Edifice. Twelve parts at 3s.; or in boards 36s.

5. DESIGNS for PUBLIC BUILDINGS, consisting of Plans, Elevations, Sections, Perspective Views and Details of Churches, Chapels, Schools, Almshouses, Gas Works, Markets, and other buildings for public purposes. By S. H. BROOKS, Architect. Beautifully engraved on steel. Ten Parts, at 3s. or 32s boards.

6. THE HOUSE DECORATOR and PAINTER'S GUIDE: containing a series of Designs for Decorating Apartments with taste, and directed in the various styles of Architecture. By H. W and A. ARROWSMITH, House Decorators to her Majesty. Ten Parts, at 3s.; or in boards 32s.

7. THE HOUSE PAINTER, or DECORATOR'S COMPANION: containing a complete Treatise on the Art of House Painting, Graining, and Marbling, including the Origin of Colour, the Laws of Harmony, including the Manufacture of Pigments, Oils, Varnishes, &c. By W. M. HIGGINS, Esq. Accompanied by actual Specimens of Hard Brush Graining and Marbling. Ten Parts, at 3s.; or in boards 32s.

THE ENGINEERS' and MECHANICS' ENCYCLOPÆDIA, a new and enlarged edition, comprehending Practical Descriptions of the Machinery and Processes employed in every description of Manufacture of the British Empire. Illustrated by upwards of 2000 Wood Engravings. By LARDNER, BERKERT, Civil Engineers, &c. The rapid progress of Mechanical Science developes many of the important facts since the first publication, in 1836, of the Encyclopædia. The inventions and improvements recently made have engaged the attention of the Editor, for as the value of one was tested, by experience, a new article was carefully prepared. By the selection of new articles, and care in the revision of old ones, the Editor has endeavoured systematically to carry out the original intention of the Work, that it may correspond with the progress of the day, and be the exponent of Engineering and Mechanical knowledge adapted to the wants of Practical Men." In two large 8vo volumes, with letter-press, price 28s.

DEDICATED, BY SPECIAL PERMISSION, TO H. R. H. THE PRINCE OF WALES.

THE ART JOURNAL,

The January Number (now ready) commences a New Volume, and contains the following interesting articles, the most important of which are profusely illustrated throughout the year:—

On the Preservation of Pictures painted in Oil Colours. By J. B. Pyne.

PEDDIE'S PRACTICAL MEASURER. A Series of Tables for facilitating the Calculations required in all the Building Trades. New Edition, enlarged. 8vo, 7s. 6d.
BLACKIE & SON, Paternoster-row, London.

NEW SERIES OF
CHAMBERS'S JOURNAL commenced in 1854 the first object of which an attempt was made to present Original Literature of a high class—CHAMBERS'S JOURNAL has persevered in its plan and design to the present time. It has been the constant aim of its conductors to elevate, as well as to instruct, apart from all sectarian or controversial subjects, and there is no reason why it should not for a long time to come continue to be conducted in the same spirit. Nothing that, in any similar periodical, can boast, those objects have been to some extent attained. Roundly speaking, TEN THOUSAND ORIGINAL ARTICLES, embracing a prodigious variety of subjects, have appeared; yet the field of observation and discussion seems practically inexhaustible. By a scrupulous attention to certain unvarying principles of management, the Proprietors have been so fortunate as to procure for their paper a circulation

CO-EXTENSIVE WITH THE PREVALENCE OF THE ENGLISH LANGUAGE.

Encouraged by the success which has attended their efforts, Messrs. CHAMBERS are leaving no means unemployed to render their Journal more attractive still; and in arranging for the carrying out of certain important changes in

THE FOURTH SERIES,

to be commenced in January, 1864, they have endeavoured to provide for the tastes of two large sections of their readers,—first, those who consider a serial tale the desirable feature of a periodical, and second, those who do not. To cater for the first section, the Proprietors have succeeded in obtaining an interesting original story, entitled

LOST SIR MASSINGBERD,

the first portion of which will appear on January 2, 1864. For the second section, as well as for readers in general, the literary matter will be improved in various ways. Many of Current Public Interest will be ably and concisely treated: the Best Books of the Day will be impartially reviewed; Occasional Notes, as in the older volumes of CHAMBERS'S JOURNAL will be revived; Carefully Selected Poetical Pieces will be added; Miscellaneous Articles of an interesting, as well as instructive nature, will continue to appear; while amongst other Mechanical changes, the principal portions of the Journal will be printed on a

LARGER AND MORE READABLE TYPE,

so as to suit the eyesight of the oldest subscribers. The Publishers have also to announce, that they have prepared, and are now issuing, an extra double New Year's Day Number, entitled,

IN THE BOX,

consisting of a number of interesting tales, arranged in a method quite original. The double number (the price of which is 3d.) is made identical from the Journal itself, and may be purchased independently of that periodical. It will, however, be the 13th in the Monthly Part published at the end of December, the price of the Part including an Index and Title-page to Vol. XX. and the New-Year's extra Number being One Shilling.

For those who may wish to complete sets of CHAMBERS'S JOURNAL, the following information may be useful:—The SECOND SERIES (1844 to 1853), in 20 vols is still on sale, at 9s. cloth. The THIRD SERIES, now completed, may be had either in 20 vols cloth, at 9s.; or in Weekly Numbers, for binding according to the taste of the purchaser, at 6*d.*

CHAMBERS'S JOURNAL may be ordered weekly, at Three Halfpence; monthly, at Sevenpence; or in Half-yearly Volumes, at Four Shillings and Sixpence, from any bookseller or newsvender in the United Kingdom or Colonies.

Back Numbers, Volumes, and Cases for binding, constantly kept by the Publishers.

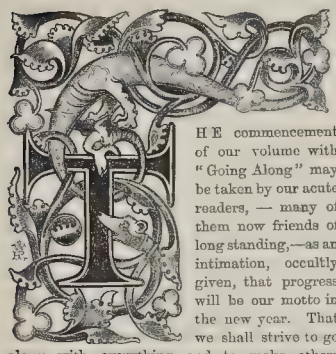
W. & R. CHAMBERS, 339, High-street, Edinburgh, and 47, Paternoster-row, London.

Now ready, with 11 plates, roan tuck, price 9s. (postage 4d.)

THE ENGINEER'S, ARCHITECT'S, and CONTRACTOR'S POCKET BOOK (LOCKWOOD'S, formerly WEALE'S) for 1864. The present volume has been considerably improved, and much new matter added

LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Now ready, Illus. strongly bound in cloth, price 4s. (postage 4d.),



THE BUILDER'S and CONTRACTOR'S PRICE BOOK (Lockwood's, formerly Weale's) for 1864. Revised by G. R. BURNELL, Esq. C.E.

This book is the universally recognized authority in the settlement of all prices necessary. New matter, in the shape of about 300 pages, is added every year, so as the case with other books of the kind: those are not to be valued, and the opportunity is taken at every reprint to introduce different prices and other improvements

LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

The Builder.

"Going Along." Milan.

THE commencement of our volume with "Going Along" may be taken by our acute readers, — many of them now friends of long standing,—as an intimation, occultly given, that progress will be our motto in the new year. That we shall strive to go along with everything and to make others go along too,—if we can. Our days of profession are over. By what has been done in the past must be estimated what will be attempted in the future. This, however, we can say, without hesitation, that the deduction we have hinted at above may be safely believed in. We have no intention to "rest and be thankful:" there will be no relaxation on our part in efforts to maintain the character of the *Builder*, as a truthful and wide-embracing expositor and recorder, a useful suggester and warner, a kindly critic; but, on the contrary, renewed endeavours, with well-founded hopes of success, to render it more and more worthy the favour that has been shown it, the high importance of the subjects that specially belong to it, and the advancing state of public opinion. This being said, with hearty thanks to many colleagues, and the hand of fellowship held out to those willing to aid in our work, we set ourselves again to write, going along, of the phœnix Milano; the *Mediolanum* of ancient days.

When Decimus Magnus Ausonius sang the glories of Milan in the fourth century, it was adorned with noble temples, amphitheatres, and baths. Now, however, the only remains of any importance of its ancient architecture to be seen are the sixteen Corinthian columns, perhaps part of the Baths of Hercules, which stand, much damaged but still grand and imposing, amongst modern structures, and close to the rebuilt church of San Lorenzo,—rebuilt, that is to say, as long ago as the time of Carlo Borromeo. A part of the ancient edifice remains in the shape of a chapel, connected with the church and with the memory of the Gothic king Ataulphus, a kinsman of Alaric, whom he succeeded in the year 411. He took captive Galla Placidia, daughter of Theodosius, surnamed the Great, of the Roman empire, who had died in Milan about the year 395, and married her. The ascendancy the Roman Lady obtained over Ataulphus was one of the causes that led to the revolt of his followers, and to his murder in Barcelona in the year 415. In the chapel we have mentioned stands his tomb, a curious semi-Classic structure, finished with the representation of a tiled top. At the end are sculptured two lambs at the foot of a cross: on the front is the sacred monogram with other symbolic ornamentation. Galla Placidia, who afterwards married Constantius III., built for herself in Ravenna a wonderfully fine mausoleum, and there was buried. She appears to have possessed the art of subjecting men to her will in a remarkable degree. That she always used this rattlesnake power to a good end is not so clear.

The ceiling of the chapel in S. Lorenzo shows some very early mosaic works, dark and hard. One is in monochrome, and represents Christ sitting in the midst of the apostles.

Of the thirty or more churches in Milan we can stop to say but little. In the one dedicated to Santa Maria delle Grazie, which is full of fresco paintings by Gaudenzio Ferrari and other artists, a picture of that kind was discovered only a few months ago, and has been cleaned and exposed to view. It includes the Virgin kneeling with Christ on the ground, and, apparently, a mother, father, and children in front. The head of the man and that of an angel at the side are particularly admirable. An altar had been set up against it, and had long hidden it from sight.

Attached to this church is the hall or refectory of a Dominican convent, containing the everywhere known "Last Supper," by Leonardo da Vinci, already alluded to. It was exposed to all sorts of ill-treatment, beginning soon after its completion,—flooded, smoked, and painted over more than once: but this has not been sufficient to destroy its reputation. It is in a better state now than it was fifty years ago. Eustace, in his "Classical Tour," written about that time, says that when the French had possession of Milan, the hall was made a store-room of artillery, and the soldiers used the heads in this picture, especially that of our Saviour, as a target to fire at. He continues, "Their barbarism in defacing a master-piece which, though in decay, was still a model of art, succeeded to the full extent even of their mischievous wishes, and has erased for ever one of the noblest specimens of painting in the world." Nevertheless there it still is. Repainted and messed, cut into and scaling off, a great part of its original beauty is destroyed. Much, however, still remains: sufficient to delight and impress. The loveliness of the head of the Saviour, the immense skill shown in the composition (all the figures divided into groups, arranged to bring prominently into view the central figure), and the variety of characteristic expression in the heads, must strike every beholder. A doorway had been cut through at the end of the hall, which took away a part of the picture in the centre below the table, including the feet of the Saviour. This, however, is now filled up and cemented. The picture occupied the versatile and wonderful Leonardo about two years; from 1496 (when he was forty-four years old), to 1498. Some years have passed since we saw the copy by Marco Uggione (or d'Oggione), now in the collection of our Royal Academy, but this has the reputation of being one of the best of the many copies of it that exist. It was painted about 1510. The remarkable letter written by Leonardo to Ludovico il Moro, Duke of Milan, which led to his engagement to the duke, and so to the execution of the Last Supper, in Milan, is in the Ambrosian library, spoken of in our last. After setting forth in it his ability to make bridges, destroy fortresses, construct bombs and bomb-proof vessels, tunnel into a town, and so forth, he goes on,—"In times of peace I think I can as well as any other make designs of buildings for public or private purposes; I can also convey water from one place to another. I will also undertake any work in sculpture, in marble, in bronze, or in terra cotta; likewise in painting I can do what can be done, as well as any man, be he who he may." This wonderful person seems to have been able to effect all he offered, but it is on his works as a painter that his fame rests. He established an Academy of Arts in Milan and produced some good artists.

In the Brera, a college once belonging to the Jesuits, and now accommodating the Royal Academy and the National Gallery, like our Trafalgar-square building, we do not remember any special work by Leonardo, unless we except a head of Christ in chalk, believed to be a study for head in the *cenacolo*, but of his great pupil, Bernardino Luini, there are many exquisite works, particularly frescoes; and there are fine specimens, too, of the skill of that Marco d'Oggione already mentioned. Many works by Luini have been called Leonardo's. The collection here is exceedingly interesting, and we might point to specimens by Paulo Veronese, Titian, Vandyke (some exquisite portraits), Andrea Mantegna (particularly his picture in compartments, with St. Mark writing behind a small marble table), Bonifazio, Albani, and many others; but this makes dull reading away from the gallery, so we avoid it. Amongst the curiosities is Carlo Crivelli's picture, in three compartments, the Virgin and Child in the centre, wherein the keys, brooches, and other ornaments project solidly, and which is thus dated (1482) in a mixture of Roman and Arabic numerals, M°. 4°. X . II.

Another is the picture by Gentile Bellini (brother of Gian Bellini), "St. Mark preaching at Alexandria." Gentile was sent to Constantinople in 1454, by the Council of Ten, at the request of the Sultan, and on his return painted this picture, showing the men and women in the rich Turkish costumes he had seen, with a view of St. Mark's in Venice, as a background. This is a very remarkable work: the centre group, in white turbans and veils, is wonderfully well managed. Garofolo's Crucifixion, too, calls for a line to note the great beauty of the figure and countenance of John, wherein are shown sorrow, resignation, faith in the dead friend, and conscious power.

The great point of attraction, however, in the Brera, is Raffaelle's exquisite picture of the marriage of the Virgin Mary and Joseph,—the well-known *Sposalizio*, painted when he was in his twenty-first year, after the manner of his master Perugino. St. Jerome's legend of the marriage supplied the text from which many artists painted, notably Perugino himself and Fra Angelico. The suitors to the Virgin amongst whom was the son of the High Priest, deposited their wands in the Temple overnight. In the morning the rod of Joseph was found to have budded forth into flowers, whereupon the other suitors broke their wands in rage and despair. In arrangement and incident Raffaelle closely followed his predecessors. It needed a thousand rills to form the river of Homer. The tender grace and beauty of the picture, which is fresh and perfect as it was on the day it was painted, can scarcely be overstated. The High Priest, Joseph, and the suitor

breaking his wand, offer features to be dwelt upon.

We have spoken of the industry of genius. Consider that of Raffaelle: the number of his compositions is as marvellous as their variety and goodness. More than 120 pictures by him of the Virgin and Child are known, and ninety portraits; numerous grand compositions, such as the Transfiguration and the Hampton Court cartoons; drawings and studies scattered all over Europe; designs for public and private buildings (he even superintended some), and at any rate one piece of sculpture. And this man died on the day he completed his thirty-seventh year, through a fever caught, it was thought, in superintending the excavations by means of which he was disinterring some of the art-wonders of ancient Rome!

A number of modern works, chiefly landscapes and portraits, were being arranged for exhibition;—some of them very meritorious, especially Giuseppe Bottani's female heads. In one of the rooms were some sculptured groups in *alto relievo*, by Magni and Strassa, intended for the cathedral, and very creditable. The price paid for these, each being 5 feet in length and 2 feet 2 inches in height, was 80*l.* apiece, we were told, and they were not dear.

The Great Hospital has several claims to attention; the earlier courts commenced in 1456, and somewhat Mediæval in character; the great court, admirably designed by Bramante, and which is a noble area with two colonnades, one above the other; more modern portions of the exterior in terra cotta, and the immense extent and capabilities of the institution. Bramante's design was not completed until 1621, when one Dr. Carcano, a Milanese, left money for the purpose. This same generous citizen left 230,000 crowns of gold to the cathedral for the construction of the façade: we noticed a tablet in the aisle behind the choir there recording it.

From a sanitary point of view we are not able to speak with precision of the arrangement of the hospital, but we do not hesitate to say it is very bad. The wards we looked into were dark and close, and their disposition around closed courts implies stagnant air and a high death-rate. This is one of the most serious defects that can be committed in hospital planning. The statement was repeated to us more than once, as we seemed incredulous, that 3,000 patients were being treated in the hospital at the time of our inquiry.

Milan is positively full of hospitals. Evidently no persons there need pay for being cured unless they wish to do so. They might wisely apply the money thus saved in paying for being advised how best to maintain their health.

Foremost amongst the works of modern time in Milan, besides two or three handsome palaces, is the white marble Arco della Pace on the Simplon-road, commenced more than fifty years ago, finished about 1838 (Cagnola architect), and re-dedicated to the revived destinies of Italy in 1859. Another offspring of the mother arch in Rome, posterity will examine the abundant and, in some points of view, excellent sculpture on it, to discover how the men of the nineteenth century looked, dressed, and worked; but in vain. All are disguised in a costume they never wore: every event depicted is foolishly falsified. In addition to a bronze Peace, in a car with six horses, on the top, a mounted figure of Fame at each corner of it, informing the world of her arrival, give the uncomfortable notion that they are about to gallop off and hurt themselves.

Real chariot-racing and horse-riding take place in the Arena hard by,—not a companion of the noble Arena of ancient Verona, that one-while raised our enthusiasm—but a modern construction, well adapted, nevertheless, for its purpose. About twice as long as it is wide, 42,000 persons, they say, may be accommodated on the seats ranged one above another around the area of display. These seats are mostly of turf, though a certain number of them near the state-entrance are of granite. The upper platform, which affords a promenade, is edged with Acacia trees. Workmen were erecting a theatre at one end of the area, at the time we visited it, for some exceptional dramatic performance. At other times they fill it with water, from the Ortolani river, for aquatic exhibitions with musical accompaniments. Talking of music, Italy is the land of song. No doubt of it. We are too grateful to raise a quibble thereanent. *But*, that the Italian multitude of to-day have much "music in their souls," judging from the street music now to be heard there, is a proposition that may be questioned. All the peripatetic music we listened to was simply execrable. Especially do we remember an agony, caused by one wandering band during a dinner at the *table d'hote* of the Albergo Reale, where, as Wordsworth says of cattle,—

"There were forty feeding like one."

Of the assembled party, a gathering of various nationalities, including, as it happened, the sister of General Turr, and a youthful friend who was with brave Garibaldi when the surgeon first touched the bullet in his wounded ankle, none seemed to suffer from the unmelodious strains as did the English. Touching that bullet, by the way, to use the words differently, the representative of English surgery came not well out of the affair; and in consequence some in Italy make game of Partridge.

The master of the hotel we have spoken of is a picture-buyer, doubtless also a picture seller. The sitting-room we occupied looked into the entrance-court, in the corner of which stands an ornamented square Renaissance pillar rescued from some "demolition;" while the chambers behind opened on to a little balcony thereto specially belonging, from which was seen a paved court with flowering plants in pots, caged birds hanging on the walls, and a fountain surrounded with flowers in the centre, making diamonds in its play with a sunbeam.

But we must be moving; so now for Como, the Larian Lake, and Cadenabbia of most pleasant memory. The declivities on either side are covered with villages, villas, and trees, the villas surrounded by flowers, the whole backed up with mighty mountains, about the tops of which the clouds hang fondly. All is still; quite still. No living thing is about: not a movement is to be seen except the tremble of the air in the hot grasp of the sun:—

"A region of repose it seems,—
A place of slumber and of dreams."

To drag, however, one of the most beautiful bits of the world into the end of a chapter, would show scant appreciation: it must be kept for the beginning of the next.

JERUSALEM EXPLORED.*

If there be one spot upon earth of more interest to all Christendom than any other, it is, of course, Jerusalem: any information concerning it must necessarily interest a large circle of readers. Not only the various persons, however, who have made the topography of the Holy City their especial study by means of books, maps, drawings, and photographs, compared with the accounts of Josephus, the Pilgrim of Bordeaux, and Eusebius, but the travellers who have visited and examined the site, and read the stories told by the stones themselves, come to conflicting conclusions. Ancient Jerusalem, crumbling and sun-baked here and there, subterranean and hung with stalactites elsewhere, and everywhere overpowered by the presence of modern Jerusalem, but still a prototype of "Jerusalem the golden, that eager hearts expect," brings to mind the chameleon the travellers saw in the desert. It is an object that presents itself in different aspects and tints to every observer. No two persons appear to form the same estimate of it; nor does it seem to produce the same impression upon any two individuals. It will be remembered that about two years since we noticed a work by Mr. Lewin, entitled "Jerusalem: a Sketch of the City and Temple, from the Earliest Times to the Siege of Titus." It was an interesting publication: but it was a work treating of topographical subjects controversially by a writer who had never seen the site he described. This was commented upon as a proceeding so open to objection, that Mr. Lewin resolved to rectify it by setting out to the Holy Land, and becoming himself an eye-witness of his description. Upon his return, he makes us acquainted with the result of his experience in the volume before us, which also contains the bulk of his former work, as well as a sketch of the great siege, and a journal of the twelve days he spent in Jerusalem and its neighbourhood. It is a subject for regret that our author did not take with him a little larger store of feeling and fervour, and a better acquaintance with architecture.

In Mr. Lewin's former work, he protested against the theory started by Mr. Fergusson, that the mosque of Omar in reality covers the sepulchre of Jesus; and, in the present volume, after a visit to both edifices, he maintains his belief that the church of the Holy Sepulchre covers the veritable tomb that was at the time of the Crucifixion newly made for Joseph of Arimathea. Nothing that he saw in the mosque of Omar justified the supposition that any confusion of sites has taken place; and nothing that he saw in the church of Constantine at all shook his faith in the belief that he looked upon the spot described by Eusebius as having been uncovered beneath the temple of Venus in the days of Constantine. Mr. Lewin repaired to the last-mentioned structure, at six o'clock on the morning following his arrival, where he found divine service going on, with a good deal of parade. He entered the little isolated chapel, beneath the rotunda which covers the Holy Sepulchre, and, passing what is shown as the identical stone rolled away from the mouth of the tomb by the angel, stooped beneath the narrow-arched doorway of the sepulchre itself, and stood by the side of the marble slab which is said to cover the tomb. He found the cell cased with marble, and highly ornamented with chaplets and candles. Not a vestige of the living rock was discernible, either within or without; but despite the absence of this testimony, our author considered the evidences and traditions in favour of his view of its authenticity to be uncontrovertible. Concerning Agrippa's wall, Mr. Lewin found evidence that induced him to recall his previously expressed opinion, which the suggestions of Robinson had caused him to form. It was a matter of doubt whether Agrippa's wall at the north-east corner of the city should be drawn in the line of the present wall or carried beyond it to the summit of a rise on the north-west, and then down again to the existing wall, a little west of the Damascus gate. Robinson pronounced in favour of the latter configuration, and our traveller sided with him from a home view of the case; but on personal inspection he reversed this decision, and feels satisfied that the course of the present wall is identical with that built by Agrippa. The high ground has been twice recently explored, first by Mr. Bergheim, the banker, for a mansion, and then by the Russians, for a convent and church, and no foundations of any kind were found. Of the three towers, Hippicus, Phasælus, and Mariamne, with which Herod is believed to have fortified the north wall of his palace, Mr. Lewin places Phasælus at the north-west corner, at which is the pile now called Hippicus. On his first view of the three towers, he thought the lower rows of large bevelled stones proclaimed the three ancient bases; but on subsequent visits he observed that the stones of the tower he has elected to call Phasælus were much larger than those of the others, and built in so compact a manner, that it is not likely that it has ever been disturbed, and that it was solid to a great height, as described by Josephus. The bases of the other two towers are not solid, nor are the stones so well joined; consequently it may be assumed that these two structures have been rebuilt from the old materials on the original sites. Mr. Lewin draws many of his archæological conclusions from the bevelling of the

* The Siege of Jerusalem by Titus. With the Journal of a Recent Visit to the Holy City, and a General Sketch of the Topography of Jerusalem, from the Earliest Times down to the Siege. By Thomas Lewin, Esq., of Trinity College, Oxford, M.A., F.S.A. London: Longman, Green, Longman, Roberts, & Green. 1863.

ancient masonry. He notes, that in one kind of bevel the channel is very shallow, leaving the central surface of the stone carefully smoothed, if not polished. The vast stones at the south-west, south-east, and north-east corners of the Haram are of this type. In a second kind of bevelling the channel is much deeper, the surface of the stones being hewn only, and not smoothed. Of this kind of masonry is the newly-recognized Phassælus. In a third fashion of workmanship, the bevel is still deeper, and the face of the stone left in a rough state. The Mek-himeh, or Town-hall, presents an example of this type. He concurs in the generally received opinion, that the bevel was introduced into Jerusalem by the Syrian artists whom Solomon invited to the city, and attributes the masonry of the Haram to that monarch. The newly-broached theory that the eastern wall of the Haram was merely a continuation of Agrippa's third wall he utterly repudiates. The stones of the Wailing-place have shallow bevels, and are finely smoothed; they are all of vast size; some much disintegrated, and others quite fresh. To a fragment of an ancient archway, exhibiting no bevel, our author assigns a still more remote antiquity, placing it among the faint traces of the city before the days of David. With regard to other controversial points, Mr. Lewin puts in a plea for the antiquity of the present Pool of Bethesda, places the Macedonian Acra on the spot assigned by many to the fortress Antonia, and the temple at the south-west corner of the Haram; accepts the position of the Garden of Gethsemane, but rejects the identity of the aged olive-trees which are preserved as having witnessed the Agony; pronounces the mosque El Aksa to be a Roman basilica, with a good deal of Mahomedan patchwork; concurs in the belief that the great cistern, recently discovered under the Haram, capable of holding 2,000,000 gallons, was the great sea which supplied the Temple with water; concludes that the large bevelled stones at the south-west corner of the Kalah-el-Jalad are a portion of the third wall, and that the chamber within is a remnant of a corner tower, which he identifies as Psephinus, mentioned by Felix Fabri. He believes Bethphage to have been a suburb of Bethany, instead of an isolated town on the site now occupied by the ruined Abu Dîs; and to his gaze the church built by Helena, the mother of Constantine the Great, at Bethlehem, presented the appearance of a Roman basilica, and resembled in many respects the mosque El Aksa in the Haram. The well of Job, he pronounces to be, unquestionably, the Eurogel of the Old Testament, where, in the summer-house attached to the king's gardens, Adonijah was carousing with Joab when Queen Bathsheba and Nathan laid their plot before King David.

The archæological traces of ancient Jerusalem are so scanty that the least addition to them is valuable: these are occasionally made in the progress of building operations. In excavating for the foundations of a new Russian consulate on the south side of the court of the Holy Sepulchre, some remains were brought to light, composed of huge bevelled stones, each of which was about 7 feet long and nearly 5 feet wide, of the same character as those in the Wailing-place and at the corner of the Haram. These are thought likely to have formed part of the second wall erected by David or Solomon.

Mr. Lewin found Mr. Schick, the architect, in course of building a new house for Dr. Chaplin, the English physician, at a point eastwards of the Jaffa gate, within the walls and in the neighbourhood of the Castle of David. In excavating what is called the "Cliff of Sion," the workmen came upon a cistern lined with cement. Upon further examination, it was ascertained that this cistern had been formed out of a still more ancient tower, measuring 8 feet from north to south, and 9 feet from west to east. It possessed a gateway 5 feet wide on the west side, with a round arch at the height of 18 feet from the floor; the total depth to the basement from the street above being 30 feet. A second tower, of similar dimensions, was found to be situate 64 feet eastwards of this, connected with the first by a length of massive walling. This line of walling proceeded past the towers, in a southerly direction, and was ultimately made use of as a foundation for one of the walls of the new house. Mr. Lewin deems that this relic of the ancient city was a portion of the old first wall of Sion, flanked with towers 64 feet apart, and overhanging the Syporæan Valley on the north. The only loophole for doubt consists in the circumstance of the gateway of the first tower turning towards the west; but this stumbling-block our topographer explains away. No direct approach to the wall was practicable from without, owing to the depth of the valley beyond it. The road was therefore adapted to this acclivity by bringing it up in a slanting direction to the west side of the tower.

Near the same spot Mr. Lewin saw a rude fragment that he thinks must have been a portion of a building in the old city before the introduction of Syrian artists by David and Solomon.

When the English church was building on Mount Sion, some years since, a conduit was discovered. The mouth of it, which is in the incumbent's house, had been hermetically sealed, for fear of accident, for one-and-twenty years; but by the courtesy of the Rev. Mr. Barclay it was uncovered for Mr. Lewin's gratification. A party of eight made the descent of the shaft by means of a rope ladder. Lighted by candles, they traced the course of the conduit eastwards, and found it about high and wide enough to admit of them passing along in single file, with a roof covered with flat stones, having openings in it at intervals, as if for buckets. The stalactites formed by the drip through the limestone soil were soft, and crumbled at the touch. After proceeding some 200 or 300 feet, their progress was blocked up by a disruption of the soil, when they faced about and groped their way westwards for some 160 feet. The sides generally had been cemented; but in one place the cutting was ascertained to be through solid rock. A low and narrow passage brought them to a sharp turn in the conduit, which, a little distance in advance, was blocked up by a wall built across it. This was the conduit in which the high-priest Ananias hid himself in the last days of Jerusalem, before its capture. In a popular tumult his palace in the upper city was fired, but he escaped to the palace of Herod; this was then besieged and taken, when he let himself down into the conduit and hid from his enemies; but on the following day he was discovered, dragged out, and assassinated. And it is also likely to have been the passage into which Simon Bar-Gioras fled, on the successful assault by Titus, intending to worm his way out, beyond the walls, by spade and pickaxe. In this, and a few similar opportunities, arising out of the period of his visit, when various excavations were in progress, our traveller had the advantage over former tourists. Mr. Barclay informed him of a well recently discovered by workmen at the south-east of Sion, which he also descended. For a distance of 15 feet this was like an ordinary well, just large enough to allow a person to descend without difficulty; but lower than that depth there was an expanse, and the explorers found themselves swinging in a spacious cavern, at the bottom of which was water. A plank was thrown across the abyss, which proved an enormous cistern, supported by massive pillars about 12 feet square, with an arched roof and cemented sides. There were some cells leading out of it, in one of which they found a skeleton. They also observed layers of Roman tiles; but some huge bevelled stones that had first attracted the attention of the workmen as indicating the foundations of some ancient palace, had been built up.

On the first day in October a party of visitors, under the guidance of Mr. Barclay, set out for Bethany. They crossed the Valley of Jehoshaphat and climbed Scopus, when the map of Palestine appeared to be unrolled before them. Mr. Lewin does not attempt to bring before us the grand, awe-striking scenery painted by Seddon, Hunt, and Carl Werner. On the north, he says, lay the bald summits of the mountains of Samaria, and on the east were the mountains of Moab, and below them the valley of the Jordan, with the course of the river distinctly traceable from the fringe of verdure that garnished its banks: the details, the tints, he leaves to our imagination. Arrived at the mosque of the Ascension, they mounted the minaret and gazed at Jerusalem from the east, with the conviction, only, that it was a very inferior view to that from the crown of Scopus. Proceeding to the tomb of Lazarus, they entered the building over it, which is rudely constructed of stones, without any marks of antiquity, either architecturally or geologically speaking; no traces of the living rock being discernible. A flight of thirty steps gave entrance into a small cave or grotto, whence a low, narrow passage turned into the tomb. In one place on the left hand the author detected a bit of the natural rock; all the rest was artificial stone-work; and the general character and aspect of the place were so at variance with the impressions he had formed from the narrative, that, if not altogether rejecting the authenticity of the site, he was disposed to look at it sceptically. The profuseness with which successive generations of monks and dragomen have created sites for the different circumstances mentioned in the inspired writings, render it imperative for the wayfarer to beware of trusting too implicitly in their authenticity; on the other hand, too rigid a rejection is as much to be deprecated; for if we exercise too fastidious a selection, we should cut ourselves off from much vivid realization of the sacred story. As a case in point, we might mention that on the return of this party from Bethany to Jerusalem, they approached the city by the road by which our Lord made his last triumphal approach to the capital, accompanied by multitudes shouting, "Hosanna to the Son of David." So certain are some minds that this was the identical route, that on turning a projecting shoulder of the Mount of Olives, and coming in view of the city, Mr. Barclay proposed that the cavalcade should halt and sing a hymn. Yet where should we look for proof of this fact? Among the spurious sites made to meet the demand, is a stone in a comparatively modern wall, in the course of the Via Dolorosa, which is marked by a deep indentation, said to be caused by the leaning of Our Lord against it, when he sank under the weight of the cross. A little further on a second stone is pointed out as that on which Lazarus sat when the dogs licked his sores; a third, with a hollow shaped in it to resemble a mouth, is shown as that referred to in the passage, "I tell you, that if these should hold their peace, the stones would immediately cry out."

Mr. Lewin and his fellow-traveller, Mr. Allcard, made a second excursion to visit the Dead Sea, the Jordan, and Jericho. As the Dead Sea lies 4,000 feet below the level of Jerusalem, we may be sure the ride was a jolting and tedious one, and can almost excuse the saddle-tired author for seeing little more in the Dead Sea than a deliciously buoyant bath, nor feeling any emotion more ecstatic than a strong desire that he could have such another in London daily. The water was tepid, and the beach unpleasantly heated: a second bath, in the Jordan, a short time afterwards, was not to be compared to this for enjoyment. Roman and Jewish Jericho are about two miles apart. The former, now represented by the village of Riha, consists but of a group of low stone huts, covered with flat roofs, made of reeds and boughs, the whole being encompassed with a fence formed of the nubk or dome, as a protection against the Bedouins: of Jewish Jericho only a few mounds and ruins remain. Upon the western banks of a stream close by, two men were wading about in a pool known as the fountain of Elisha, carefully turning over every stone. They were fishing for crabs! In like discordance with our associations, women were found washing clothes when Mr. Lewin visited the pool of the Virgin, and a man washing his feet in the pool of Siloam.

The return from Jericho to Jerusalem is as steep as the journey down is on the decline, and brings to mind such passages in the Evangelists as relate to the going up to the Holy City; but there is a less precipitous route than that by the convent of Mar Saba, which was chosen on this occasion. At the entrance into the mountain-passes lie some extensive ruins, which Mr. Lewin would have concluded to have been the remains of the amphitheatre built by Herod, if Josephus had not explicitly described the site of this building as being on the plain. Between Riha and the mountains can be seen a large dry reservoir, near a fragment of an aqueduct; it is here that the author suggests the Amphitheatre should be looked for. The remains of a caravansary, about half-way between Jericho and Jerusalem, the only trace of habitation to be seen between the entrance of the mountains and Bethany, in a neighbourhood haunted by Bedouins, give life, colour, and reality to the incidents of the parable of the man who fell among thieves, who stripped him of his raiment, and wounded him and departed, leaving him half dead, and of the certain Samaritan who had compassion on him, and set him on his own beast, and brought him to an inn; but to assume that it was the identical building referred to, would be as culpable manufacture of a fictitious site as those of the monks and dragomen.

Those will most enjoy Mr. Lewin's book who have gone over the ground themselves, for he writes rather to clear up doubts and lay down the law on controverted points, than to create new pictures in the reader's mind: those will

next best enjoy it who read it as a commentary upon more pictorial works of the Holy Land, or as an exposition of such a series of pictures as those of Mr. Werner. His arguments as a topographer are very forcibly given.

NEW MATERIALS FOR THE LIFE OF HENRY FUSELI.

IN the nearly-completed first century of the "Royal Academy of Arts" in England, the Academy has had EIGHT several "keepers,"—keepers of its treasures out of the Three per Cents. Very different-minded men have these eight keepers been. Read their names, and reflect on what they have done in Art and towards Art! Here they are:—Moser, Carlini, Wilton, Fuseli, Thomson, Hilton, Jones, and Charles Landseer,—six painters and two sculptors,—not a very remarkable enumeration of names, and chiefly noteworthy for its including Fuseli, a person among "the forty" whose reputation rests more upon what he said and might have done in eighty-four years of existence, than on what he did.

It has been said sarcastically enough of Fuseli that he was a scholar only among Royal Academicians; for West, Nollekens, and Northcote wrote ungrammatically, and spelt hideously. I have seen a letter of President Benjamin West's to Francis Chantrey, in which he calls our Phidias of bust sculptors a great "sculpture." Fuseli, though a foreigner by birth, was a master at times in writing the English language. His lectures, it is true, are often grandiloquently obscure beyond the happiest commentator's apprehension; but his few Homeric contributions to Cowper's "Homer" are immensely fine.

Of this now nearly forgotten man I have something new to tell. The keeper of the Royal Academy of Arts in London is a resident official. He is supposed to be always heard of. Candidates for studentships in the Academy make their applications to the keeper of the Academy. Fuseli, in his twenty-one years of office, had many applicants to see, to reject, and to admit; to flatter, and at times to insult. The painter who voted for a woman (Mary Moser) as president, in opposition to West, on the plea that one old woman was as good as another, found his greatest academic difficulties with women. A kind of Mary Moser, who came to the Academy to draw and learn, has put on paper her recollections of Fuseli; and from her narrative (hitherto unpublished), the new materials of my present communication are principally drawn.

The lady correspondent of Allan Cunningham was no common observer. What she has to say is worth telling, and is told with the ease of a ready writer:—

Miss Patrickson to Allan Cunningham.

Dumfries, Sept. 14, 1830.

I have just laid down the second volume of your "Lives of British Painters," after perusing that of Henry Fuseli, the only one I have yet read. All who knew and admired that extraordinary man must feel gratified and grateful on finding his great talents so ably, eloquently, and justly described; but you have not done justice to a thousandth part of the kindness and goodness of his nature; nor could any one who had not enjoyed great facilities of intercourse. The first eager perusal has not left with me the impression that you were intimately acquainted with him. I write from the experience of years, and I shall not do you so much injustice as to apologize for addressing you. The biographer who could so appreciate and vindicate the genius of the artist, will not peruse without interest an honest tribute to the amiability of the man, though the style in which it is recorded should be tedious, diffuse, and feeble.

The "Lives of the British Painters" will no doubt afford (by demands for future editions) opportunities for corrections, additions, and the statement of fresh facts, such as the publication of the biography of eminent individuals must always elicit. I shall not attempt to draw up a character of Mr. Fuseli; I am not capable of doing so; but I shall give a plain statement of what I know to be true, such as all who know me have repeatedly heard me state in conversation; trusting it may induce you, in your own language, and as briefly as you choose, when you have occasion to revise the life of one to whom you have already done so much honour, to add that which is so justly his due.

I have no time to arrange the materials with which my memory is so amply stored; and which, never dormant, are now by the perusal of your work, raised into such importunate activity, that they crowd upon me almost to embarrassment. I shall give them pretty much as they rise, though in so doing I must bring myself forward in a way you will no doubt find tiresome; but it is necessary (at least I think so), for I cannot expect you to act upon my assertion unsupported by facts.

Many of my acquaintances and associates among artists and students wished to persuade me that my great admiration of Fuseli was not genuine; but arose from the gratitude and regard excited by his kindness to me; alleging that colour was what I was most successful in, and that in the few original attempts I made, I never copied him. I never thought of copying him! They might as well have said, because in my idle moments I strung rhymes together and called them songs, that I thought a ballad a finer production than an epic poem. Fuseli himself taught me better. "Never copy the manner of any one. If you have opportunity, copy the best works you meet with; if you have not, study them well. Do not confine yourself to one style or one master. Take nature for your model, and your style will come of itself."

If mind could be copied, I would have chosen his. My acquaintance with Mr. Fuseli was the result of my admiration of his works, and I never even saw him for many years after that admiration had been excited; for I was only twelve or thirteen years of age when Moses Haughton, the miniature painter, took me to see, for the first time in my life, the exhibition at Somerset House; and there I saw the first of his paintings I ever beheld (I knew every print- and book-seller's window between Bond-street and Cornhill; and had spent much time looking at a print of "The Nightmare," as the frontispiece to a small book): that painting was the "Ugolino," and never has that magnificent picture faded in its effects upon my mind. I remember where it hung, and the general appearance of the rooms, but not another picture which they contained. I was glad that it was painted by Mr. Fuseli, and contemplated my old friend "The Nightmare" with additional pleasure. Mr. Haughton was kind enough to ask me to go to Queen Anne-street, where he was staying, in the absence of Mr. and Mrs. Fuseli, to see some more of his pictures. I went early one morning, and staid many hours, passing nearly the whole of the time contemplating the "Lazar House." I saw the Shakespeare Gallery, where, again, Fuseli fixed my attention; and I remember when I at last saw himself, I thought that his head was not unlike that of his own Prospero. I by some means scraped up a sort of acquaintance with Mr. Harrison, a partner or manager of Alderman Boydell's, and he invited me to go to the shop whenever I liked. I used to go, and was always accommodated with a stool, a portion of counter, and as many portfolios as I chose; and I hunted out everything of Fuseli's that it was possible to get at. For about a year and a half before I became acquainted with the great artist, whose works I already so much admired, I had taken lessons in drawing, first at the academy of John Young, the engraver, afterwards keeper at the British Institution; and after of Mr. Hayter, father to the historical painter. At the first place, my taste was treated with ridicule; at the second, I heard many accounts of Fuseli as keeper, which, added to the manner in which I had long before heard Mr. Haughton speak of him, induced me to believe that the man was not inferior to the artist.

I was nineteen or twenty years of age when I had first the honour of being introduced to Fuseli, and with no farther preparation than being invited the day before by his wife, whom I met at the house of an uncle of mine. I took with me, by her desire, a portrait in Swiss crayons (a copy). Fuseli liked it very well, and told me he would always be glad to look at what I had done, and give me his opinion. I copied a portrait of Sir Joshua's—my first essay in oils; and which was as hard a performance as could well be imagined. I expressed my regret to Mr. Fuseli. "Never mind," said he, good-naturedly, "I do not object to a little hardness at first: you will soon correct what will so much offend your eye. It might not be so easy to find a remedy for original feebleness." He lent me a portrait of himself, painted when he was thirty years old, at Rome, by Northcote. I did my best, but I was pretty sure, though he was kind and polite, that he thought very little of my best. He recommended me to make a second copy; and it was so like the first that he expressed himself disappointed, but with no rudeness or ill-nature. I offered to make a third. "No! I was quite inexperienced; perhaps there was something in Northcote which baffled me; he would find me something in a different style." He did so, and lent me Opie's portrait of Mrs. Fuseli. I copied it with great ease to myself, and quite to his satisfaction; and it was evident that he had as much pleasure in giving praise as I had in receiving it. I went home happy, for he had shown me several faults; therefore I knew he thought I should improve; and I had ventured to ask for one of his own pictures, and obtained it.

It was shortly after this that in showing Mr. Fuseli a chalk-drawing, made under the direction of Mr. Hayter, that he discovered what I thought he had never been ignorant of, namely, that I still took lessons of that gentleman. He was very indignant; said that he could not share a pupil with Mr. Hayter, and that I must make my election; that if I chose to consider myself his pupil, he was willing to consider himself my master; that he would give me the best advice and instructions in his power, and lend me anything in his possession; but that he must have me to himself. Who could have granted a greater favour? Who could have done so with more kindness and delicacy? And can it be supposed possible that I can express how deeply and gratefully I felt it! Until I left London, in an almost hopeless state of health, a period I think I may safely say of seven or eight years, I enjoyed all these advantages. He lent me pictures, books, and casts; allowed me to show him everything I did, and, if original, in different stages; admitted me at all times to his study—(the porters, not only Sam, *par excellence*, but fat Sam, and Charles, never thinking any more ceremony necessary than "Mr. Fuseli's in his own room, Miss");—permitted me to draw in the Academy on Mondays and during vacations; and invited me to choose objects in the council-chamber, and draw by him while he was painting his great picture of "Hercules assailing Pluto," which I did for several weeks.

I was not naturally shy, but I never overcame my awe of Fuseli; and, to the last visit I paid him, never knocked at his study-door without a palpitation of heart almost painful: yet such was the charm of his conversation and the kindness of his manner, that my visits generally extended to several hours: and in the lonely little room where I pursued my studies in perfect solitude, where I lived over again in retrospection all he had said and how he had looked, I was astonished and ashamed when I recollected the freedom with which I had expressed my sentiments and opinions, and still more at the questions I had asked. Many were the resolutions I made never to do so again; but they were all forgotten.

"Have you been to see de 'Miraculous Entombment?'" "No, sir." "Why not? All de world is going." "I don't like the name, sir." "You don't like de name! What, de devil! is it not fine enough for you?" "It's so ridiculously fine, sir, that I thought nobody who knew a good picture would have bestowed it on one." "Well, it's a d——d bad name, to be sure, but it's a very fine picture; you must go to see it." I readily promised. He then asked me if I knew anything of Spada. I did not. He told me he was a man of strong but coarse mind, perfectly capable of painting all he saw; that he was, or had been called, I forget which, an imitator of Michelangelo; but that he had no grandeur. He then left his picture, took a bit of chalk, and upon a blank canvas sketched me the arrangement of the picture, showed the effect which had produced its wonderful name, charged me not to let any want of agreeableness destroy my interest, and enjoined me to study it carefully. Those who know how tenacious Fuseli was of his time, how much he hated interruption, and anybody in the room with him when he was painting (he never could comprehend West painting with his porter in the room, and letting him set his palette, and often mentioned it), can estimate the kindness which led him often to leave his own work and employ himself upon mine.

I, one day, in the Council Chamber, threw down my port-crayon, and quitted my seat, with more vehemence than I was in the habit of using. He came to ask what was the matter. I said that I could not draw my figure, and it was no use trying: he said, "Oh, it was great use trying;" and seeing I was quite discouraged, added, "Come, then, give me the port-crayon, and if you cannot manage de lady [the little sitting Venus, with a drapery over her knees,

and her right hand holding her left foot] let me try if I can." He went over some of the lines and corrected others, while I stood behind. "A d——d little difficult devil of a figure, after all. You are not so unreasonable as I thought you." There is no giving Fuseli without swearing. Why is it that swearing in him never gave offence? At least, I never heard that it did. In my own opinion, it was accompanied by no profanity of mind. His feelings vented themselves in the most energetic language he could meet with (it should never be forgotten that he was a foreigner: the English never scruple at foreign oaths; they use them as expletives merely, for they alarm not the conscience by suggesting profane ideas. *Diable* and *Diavolo* are pronounced without hesitation by youthful and female lips, which refuse to utter the word *devil*, and half convert it into a joke, by substituting "*the old Gentleman.*" Imprecations share the same indulgence), as they did in those attitudes and strainings of the muscles which were so generally called extravagant. Fuseli drew no stronger than he felt; his feelings and his mind are alike upon his canvas. If ever a "body thought," that of Fuseli did; every muscle and tendon in the movement of a finger, the extension of an arm, the throwing back the head, the elevating the eyebrows, was instinct with mind and feeling.

The students, who (as you observe), were fond of relating anecdotes of him, naturally chose for the amusement of others those which had amused themselves; but, notwithstanding his vehemence, many spoke of his good-nature, which with very young people generally means kindness. I remember an anecdote of him, told me, perhaps, because I knew the young man concerned. Keir, a young Scotchman, of gentlemanly manners, mild and modest, with quick and sensitive feelings, was unfortunately deaf and dumb. He entered the Academy a few evenings after his admission, when, not finding a seat, and unable to ask assistance, he stood in a state of painful embarrassment, which some enjoyed, and no one tried to relieve. Fuseli entered and addressed the embarrassed stranger, but poor Keir could only blush and bow. Some one told Fuseli of his infirmity, and that he was looking for a stool. "Looking for a stool! and why does no one give him a stool?" There was not an unoccupied one in the Academy. Fuseli signed to Keir to wait, hastened to his own room—no trifling distance,—and brought one, which he presented to the youth, with many bows and apologies for having had it in his own room; assisting him at the same time to arrange his work. The students were delighted with Mr. Fuseli, and as ready to applaud him, as the Athenian youths were the Spartans, when they showed that respect to age in which they had just proved themselves deficient.

Two things I remarked in Mr. Fuseli, that he never omitted an opportunity of imparting information or instruction; and that if he had hastily wounded the feelings, he was solicitous to heal them. For myself, I am sure such occasions did not occur six times during my acquaintance with him; and when they did, I would have suppressed any manifestation of being hurt if I could, but I never in my life could control any feature but the eye; that, I could cast down, but a changing cheek and a quivering lip always betrayed me; and if my face was turned away, my voice was a greater traitor still. I once met with a reception similar to one you have related, but the result was different. "Come in," in a sharper key than usual, had answered my knock at the door, and I involuntarily said as I entered,—"I hope I don't interrupt you, sir?"

"You hope you don't interrupt me! Yes, you do interrupt me. Everybody interrupts me." "But, sir, I'll not come in." "Oh, yes, come in, come in: I am very glad to see you notwithstanding; but never say dose foolish things. You don't say them often, but never say them at all! How can you, or any one, come in without interrupting me? And when you say, 'I hope I don't interrupt you?' I must either say that you don't, which would be a lie; or I must say that you do, which is pleasant to neither. Never run the risk of putting people's politeness at variance with their sincerity,—of laying them under the necessity of being rude or insincere." "Well, sir, "I'll endeavour not to say anything of the kind again." "That's right; now tell me your news. Sit down on this chair; I will take away my snuff-box: will you have a pinch? No, you don't like snuff; well, I will. You will like snuff in time: it is a great help to composition."

Mrs. Piozzi has left us the pleasing record, that Johnson was never so entertaining and instructive as when he felt that his temper had betrayed him into too harsh a reproof of ignorance or folly. I have spent much time at Streatham Park, when it was rented of the worthy Thrale's flippant widow, by a family with which I was most intimately acquainted. All the furniture was there as it had been when Johnson was the presiding genius, surrounded by all the living talent, whose portraits by Reynolds (himself among the number) then graced the ample library. All the place was hallowed by domestic associations and anecdotes respecting that wonderful man. I reverence Johnson, but I cannot persuade myself that he could make reparation with that grace, playfulness, and feeling, which in Henry Fuseli brought a smile to play round the mouth, while the tear was still a tenant of the eye. I was about to apologize one day for having been in his study, Mr. Haughton having taken us there, with a lady, when he came to the door, and, seeing a stranger, made a hasty retreat. "Oh," said he, "I suppose I made a face at you: you must never mind me; I make faces sometimes, but I am always very glad to see you." One of the stories of him which I like best was told me, I think, in the British Gallery by Mr. James Ward: whoever it was professed to have it from Mr. Northcote himself. When he and Fuseli were at Rome together, it was the custom in the theatre for the female characters to be played by boys; and there was one night one of such exquisite beauty, and that, too, with respect to delicacy, that the audience forgot the interest of the piece in their admiration. Northcote gave vent to his in words; and when he had exhausted his vocabulary and his ideas, turned to Fuseli, who said, "He makes all de women in de house look like men." Fuseli was very conscientious, and always careful not to mislead me. "My wife," said he (for when I wanted to ask anything very unreasonable, I always applied to Mrs. Fuseli), "tells me you want to draw in de antique academy." I said "Yes." "Very well; you are very welcome; but you will find it very cold, for I have no right to ask the porter to light a fire in the absence of the students." I waved all that, and he told me when it would be vacant. I said I would go on the day following. "Very well; but perhaps you would not like to come on that day—it is St. Stephen's day?" I did not observe those days. "Well, I don't observe them myself, but don't let me be any guide to you; never do as you see me do if you have any doubts. Never do anything to offend your conscience!" I went, and drew some days in a hard frost, with a bit of velvet sewed round my portcrayon, which I could not otherwise have retained in my fingers. He paid me two or three visits every day to inspect my progress, and invite me to warm myself at his fire. Sam soon made the latter unnecessary: he seemed to feel great pride in my devotion to the fine arts; regularly made me a good fire; and inspected my studies himself. He liked to come when he knew Mr. Fuseli was away, and give me his opinion, and I was quite as ready to hear it; for Sam rarely said,—"Now, Miss, if you'll just imagine a straight line dropped from such a place, I think you'll find that foot too forward, or too backward,"—that I did not find he was right. One day in the council-room he had been giving me his advice, when, as he went out, he cast his eye upon the Hercules: "Mr. Fuseli haven't altered that leg yet, I see, as I told him yesterday was wrong!"

I liked Sam excessively; he was so identified by himself, and every one else with the Academy, and there was so much composure in his self-complacency, that I admired him greatly. He liked my admiration of Fuseli, and was fond of increasing it. A favourite anecdote was his taking the portcrayon out of a student's hand, and drawing that of the Hercules in four strokes. In one instance only, Sam failed to influence me by his eloquence. He was goodnaturedly anxious that I should become a regular student in the antique, and I dare say if he had been satisfied with my progress, would have thought me worthy of being admitted to the life. "Lord, Miss, you'll never improve, drawing this way by yourself. You have no idea what a difference you would find if you were here with the young gentlemen; and if you asked Mr. Fuseli, he would give you leave directly; I am sure he would."

Mr. Fuseli's good breeding in one particular made a strong impression upon me; he never made qualifications or admissions on the score of my being a female. The contempt so commonly expressed by "very well for a lady," would at any rate have been too coarse for him; but the idea never seemed in any shape to enter his head. "You are like all the other *boys* in the Academy; you want to make a large figure upon a little bit of paper;" or some other of the common errors of inexperience, was frequently the style in which he addressed me. He expected the ordinary results from the ordinary advantages. When I showed him some anatomical drawings I had made, he said they were neatly executed, but from bad examples. I had hoped to obtain the large plates of Albinus, but had been disappointed. Well, he could not lend me them, for he had not got them, but he could lend me a very clever book if I would take care of it. This I promised: he went and brought it. "The plates," he said, "twenty-seven, are small, but very good; the letterpress, which you can't read, is by John Lav-ater" (he always pronounced Lavater with the accent on the first syllable), "son to the physiognomist. It is dedicated to me, and the only copy, I believe, in England. If you lose it or injure it, never come near me again, for I will hang you with my own hands."

I was drawing one day in the Academy when the weather was very dull, and it was difficult to find any light or shade. He was passing through, and, clapping his finger on the "Fighting Gladiator," from which I was drawing, cried out, "What is dis?" I looked up suddenly, with my head full of my difficulties, and said, "A light, sir." "A light! Any child could tell me that. It is the *Trochanter Major*. Do you make no use of what you learn?"

Another time he told me that hair had a shape if I would look for it; and he would advise me to do so immediately. When I showed him my first portrait, which was that of a middle-aged gentleman with a round face and small features, very fair and much colour, he laughed heartily. "Oh, what an unfortunate girl you are! I am very sorry for you. You have had a man to paint with neither light nor shade in his face. Why, he's all pink and blue, and red and yellow, like a squeezed peach!" I never could resist a joke, however much against myself, and laughed as heartily as he did. As a pupil, no severity of remark ever offended me: I wished to know my faults. It was a capital criticism, well worth painting a bad picture for. He was no niggard of praise, where praise was merited. I usually sent my copies the day before I called, that he might compare them with the originals at his leisure; and the first salutation generally let me fully into his opinion. When I had copied the "Othello and Desdemona," "I congratulate you! I give you joy! I congratulate you sincerely! You have pleased and surprised me. You have made an excellent copy. I knew you could paint Othello, but I did not think you could paint Desdemona: she is very difficult. You ought to be very happy."

Some time before I had chosen for myself a design from Cowper. Fuseli rather recommended another, which, by way of compromise, I said I would take the next time. He smiled, and let me take my own way. I never had such trouble in my life; but, persuaded it was only my own stupidity, I worked on, trying every expedient I could think of, and at last made something like it. "Well, I like your copy very well. Did you find it very easy?" "No, indeed, sir; I could hardly do it at all." "I did not expect you would do it at all. How did you get the man?" "Oh, I know I did not get him rightly. I got him as well as I could." "But how did you get him? What means did you use?" "Why, sir, I painted him several times; but he never was the right tint, and never looked like yours; so at last I was obliged to take one coat of thin colour after another, for I could not get it any other way." "And a very good way, too. I got it myself by one coat of thin colour over another; but it is a way you must not trust too much to."

Fuseli never sought to dazzle me by a display of his own knowledge, and carefully avoided confusing or embarrassing me by too many instructions or too much information at once. The *bourgeois gentilhomme* was not more overwhelmed by finding that he had been speaking prose for forty years than I was some time afterwards to find that I had actually perpetrated *glazing* without knowing it. He would say to me, "Do you remember when you painted such a picture?" perhaps three or four months before. "Yes, sir." "Well, what did I say to you respecting it?" I would tell him. "And you are sure I told you nothing else?" "Yes, sir." "You are right; but I could have told you something else, but you would not, as well as you can now, have understood me. You have mastered what I told you then: you must pay equal attention to what I tell you now." He would

then, as clearly as if the picture had been before him, point out the defects of my inexperience, and instruct me how to avoid them in future. It was relating this and other instances of Mr. Fuseli's mode of instructing me that made the late George Dawe exclaim,—"Miss Patrickson, if you live to be a hundred years old, and paint every day of your life, you won't know at its close the extent of your obligations to Mr. Fuseli."

I have heard Dawe accused of meanness and avarice: it might be true; I knew but little of him. He gave me one day, in the British Institution, a piece of information respecting colouring which has been useful to me ever since; and he was fond of conversing upon art and artists. "I don't like your friend Dawe's eye!" (said Fuseli to me, one day); "he has a cunning eye,—a d—d cunning eye!" "Dawe is not particularly my friend, sir." "Well, I don't care whether he is your friend or not; I don't like his eye; I would not trust that eye. Whether he is your friend or not, you were very anxious that he should be made an Associate." "I meet Mr. Dawe sometimes, sir, and he is always very good-natured to me; and I liked his picture, and so did you; and you told me that, being, in Mr. West's absence, in the chair, you did not vote; but, had it come to a casting vote, you would have given it to him." "Well, and you told him so; and he came to call upon me. I suppose he wants to be an Academician."

Sam came into the room one day with a roll of drawings, and the compliments of one of the Academicians, I forget which, requesting Mr. Fuseli to look at them, and, if they met his approbation, to permit the young man to draw in the Academy. Fuseli did so; gave his permission, and requested he would give his compliments to the gentleman he came from, and say he was much obliged to him for sending him so clever a young man. I have known instances where Mr. Fuseli refused permission, and counselled longer study at home; but never knew or heard of one in which he wounded the feelings of the applicant.

Fuseli himself gave me the particulars of his re-election to the Professorship of Painting. I had been reading his Lectures (the three first published), and was combating, or endeavouring to combat, his own censures upon his own works, which he denounced as too florid, and intended to correct. "I dare say you like the style," he said, "you are young and enthusiastic; but as you grow older, your taste and judgment will improve, and you will learn that the simple is preferable to the florid." I asked him how Mr. Opie came to be elected Professor of Painting. He explained that a law of the Academy forbade one individual holding two appointments. "But you hold two now, sir!" "And you want to know how that has happened. Well, I will tell you." He then told me that when Opie died, Tresham was appointed. Tresham, I think he said, died or resigned, without delivering any lectures. The professorship was then declared vacant, and a time appointed for sending in applications. The time expired without one offering. He then wrote to the Academy, stating (his own expression), that as it was an indecent thing for the British Academy to be without a lecturer on painting, he was willing, without any remuneration, to deliver his lectures as formerly, until one was appointed. He was immediately re-elected.

I shall continue Miss Patrickson's "Recollections," and conclude what I have to say of Fuseli in my next communication.

PETER CUNNINGHAM.

MONTREAL.

THE possession of good building-stone is even more advantageous to the art-character of structures in a city, than might at first be expected. It conduces, or is favourable, to a more general regard for design than we witness many results of in a place like London, where stucco is the ordinary material for attempts at decoration. The exceptional case of the stone-fronted buildings in the City of London, about the Exchange and the Bank of England, where architecture of a creditable sort prevails, tends to prove the rule, which we may be justified in laying down, that the opportunity of employing ready-cast details of ornament is unfavourable to the manifestation of study, and to the order of merit required in the production of works which may be those of the true art. It seems to be unfavourable even in the buildings designed by architects. In London however, the services of architects at all, would appear to be dispensed with, or sought for, much as according to whether the building is to be stucco-fronted or built of stone. There is a good illustration of the unfortunate results of use of imitative stucco, in some of the details of the front of the building lately finished in Pall-mall for the Institute of Painters in Water Colours. There, the general forms are good: their arrangement in the upper stories indeed, is particularly clever; and the whole treatment of the difficult case of a very narrow-fronted structure, without being ruined in the effect by the appearance of the party-walls at the top, is a lesson. But in the ground story, the eye is shocked by the vulgar masks, or console-heads, of the side doorways, which are two of the worst things that could be found in any plasterer's shop. The curved pediment of the central doorway also, is less satisfactory than it might have been made.

The use of stone, to which we are attaching importance beyond what might be at first supposed in considering the material, is in our mind one cause of a generally satisfactory architectural character that we find, is becoming declared in one of the most important places in the colonies, Montreal. We have heretofore, given one or more views of buildings in that city; and our attention is again drawn to it, by a copy of the *Montreal Herald* of September 15th, which publishes as "Illustrated Edition," two large sheets, with ample and minute particulars, of all the building-work in progress at the time, in the city, arranged under the names of the several streets. The sheets contain about twenty woodcuts, some of which are engraved in superior style. The same journal has given previously, similar accounts of building progress. The fact of this, and the manner in which the particulars in the present case are given, deserve to be set down as very creditable to the *Montreal Herald*. The journals at home, in the little they attempt, do not acquit themselves better than has the colonial paper in the present case.

The impression produced upon us by the printed particulars, is that there is in Montreal, an appreciation of architectural effect, or a yearning for the production of art in building, which is so far decided that it may be taken as promise of important works in the future. Beyond the advantage that such a city has in the possession of stone, there is we suppose that other which generally results from the use of wood as fuel; for, as we have lately endeavoured to show, a thick and smoke-laden atmosphere, which we always have in London, and especially in winter,—a time when the Canadian atmosphere is clear,—is unfavourable to the production of architecture with us, as it is to the visual perception, to the popular appreciation, and to the preservation and economy of it, when produced. So far, we find that Montreal has advantages which are those of Paris; and, possibly, traditions, and the French race of descendants of the original colonists, are not inoperative to the desire for decoration and art: for, there is unquestionably a marked difference between this race and the Anglo-Saxon, as to the importance attached to decoration relatively to simple utility. Another advantage which Montreal has over London, is like that which Paris, and even Manchester has: it is comprised in the larger size or frontage of the buildings. A "store" indeed, may be a simple *shop*, named in the American vernacular: but the tendency of colonial and American wants and habits is towards the formation of establishments for sale of many varieties of articles. "Stores" therefore, have generally the advantage of dimensions; albeit a large building, as a small one, may be spoiled by a basement of glass, uninterrupted, as are the basements of the buildings in Paris by that saving feature, the *porte-cochère*.

Recent buildings of Montreal, indeed, are, or many of them, due to architects who have lately gone to the colony from England. The satisfactory part of the matter, and that which is creditable to the colonial public, is the general employment of architects. The *Montreal Herald* deserves to be thanked for giving in nearly every one of the cases, in its long enumeration of recent works, the name of the designer. The names that we have collected, are those of Messrs. Lawford & Nelson, J. W. Hopkins & Frederick Lawford, Larue & Colborne, John Hester, H. M. Perrault, M. Laurent, A. B. Taft, John James Brown, W. H. Hodson, Savage & Windeyer, J. Garven jun., C. P. Thomas, J. H. Wells, and Fahrland. Several of these have in hand, many works.

Without a plan, it is difficult to realize the whole character of the architectural movement which Montreal must unquestionably be exhibiting, or see what importance the many streets and buildings that are named, bear to the general city. Great fires have helped to the demand for new structures, as in New York. In future, however, the prevalence of the destroyer, but sometimes helper to architectural life, may be lessened. At least the materials now named as used, are generally "stone," or "cut stone," or "Montreal stone." Frequently however "brick," or "brick and stone," are mentioned as the materials of fronts. Where brick is used, it is often described as "on stone *foundations*;" that is to say, the ground-story, or basement, as with us, is stone, or stone-fronted. In the internal fittings of houses, there is no lack of expensive material and work; and in one case we note mention made, not merely of "marble mantels," but of "wash-stands" of the same material, as though the latter were fixtures. There is strangely prevalent error in these days of the diffusion of knowledge, as to the civilization of the colonies; although the Exhibition of 1862 should have left no delusion with those who saw the works, even of taste or luxury, from the colonies, on the occasion. Canada at all events, has passed, by some small number of centuries, an epoch in history of our art when mere building is supposed first exchanged for architecture. The principal difference between Canadian buildings and English, seems to consist in the materials of the roof-covering,—tinned-plate being often used,—and in certain provisions rendered necessary by the climate. Thus, a covering of slate slabs, would have to be designed very carefully to allow for the immense difference between the temperature of the summer and winter. For the latter season, there are special provisions of heating. No house would be thought habitable without them, or with nothing more than open fire-places. So that, Canadians spending a winter in England, complain much of cold indoors. A very simple arrangement of furnace in the basement of a house, for hot-air, with flues to the skirting of each room, is what is generally described to us; but in the *Herald*, mention is made in many cases of Gold's Patent Heating Apparatus.

Going back to the printed account, we find descriptions of public gardens, with drinking-fountains; and frequently we read of sculpturesque accessories of the ground attached to houses, and of other features which we associate rather with Italy than with Canada. We should have no farther faith indeed, in some of our theories, did not art gain something in a country where nature is so grand.

The city of Montreal contained in 1861, as found by census, a population of 100,000; and our authority gives it, by estimate, as now 120,000. The city is rapidly extending; former swamps are being covered by suburban mansions and blocks of dwellings; the wharves are extending far eastward; whilst, in the heart of the city, churches, banking establishments, and other public edifices, are rising up, and are of the improved character that we have spoken of. It is to be hoped that the sanitary requirements of such a city keep pace with the extension. The paving at least, is said to be greatly improved.

There are similar styles of architecture in Montreal, to those which are observed in England; and there is the same characteristic of different styles contemporaneously prevailing. Generally, as with us, the prevailing street architecture, and such buildings as banks and club-houses, are "Italian;" whilst the churches are Gothic. The recent Gothic is certainly superior to colonial Gothic in general. One of the most important works in Canada, considering purpose and size, is the Parliament Buildings at Ottawa. We some time since gave a view of it as designed. It has ranges of pointed-headed windows, of the Oxford Museum Gothic character, masses as pavilions with lofty roofs, and a central tower with a high truncated, but coronet-finished, capping.

The Gothic has changed greatly since the date of the Roman Catholic Cathedral of Notre Dame, a building which has very Batty Langley details. St. Andrew's church is of Early English style. It has transepts, and a western tower with broach-spire. In the view, it seems to stand on a lower level of ground than that of the surrounding streets. From these there are external stairs to side doorways of a story of the tower above the western entrance; the arrangement seeming to show that galleries are reached that way. Christ Church Cathedral is really a very meritorious work in Geometric Decorated

Gothic. It is a cross-church with central tower and spire, aisles and clerestory, octagonal and pyramidal capped chapter-house, and south porch; and at the western entrance is a porch of three arches and canopies, which though scarcely harmonious with the rest, is itself well designed. The Church of the Messiah is Romanesque. It is to be finished with a square campanile on the Italian model. The French Protestant Church, in Craig-street, to which schools and residence are attached, is a building to contain 450 sittings. It is of plain Early English character, and has a projection (*quasi*-tower), in the centre of the west front, which with the wall carries a spiriel-crowned belfry. The church of St. James, St. Catherine-street, is a small building of good Early English character: the tower and spire at the side, however, are too much as those of a large church reduced.

Of the non-ecclesiastical structures, (always excepting that wonderful work the Victoria Bridge,) one of the principal illustrated in the *Herald*, but which may not be of last year's date, is the Bank of Montreal. It has a portico of six Corinthian columns, antæ at the angles, and an attic terminated by a dentil cornice and *antefixæ*. Though the portico has windows at the back, there is good effect in the whole building. The City and District Savings Bank, and Liverpool and London Insurance Company's building, one of those of which we gave a view some time since, is Italian with superimposed orders, and crowning attic story, cornice and balustrade, all excellently treated. The Ocean Steam-ship Company's Offices form a small two-story building with Italian coins and window-dressings. The Colonial Life Assurance Company's buildings have a three-storied front, of Italian character, but having some novelty in the details of the upper stories. The basement has three rusticated arch-headed openings.

Of the buildings which are at this moment about completion, the best is the new Ontario Bank, in the Place d'Armes. Messrs. Lawford & Nelson are the architects. It is a structure of four stories of windows, and those of the basement; and is of Italian character, with architraved, corniced, and balconied windows, all, with the string-courses and cornice, being pleasingly varied. The jambs and archivolts of the openings of the ground story, and other architraves, are vermiculated rusticated. The *Herald* calls this last kind of ornamentation, *picque*-work.

The Royal Insurance Building, of which Mr. J. W. Hopkins is the architect, is now about finished. It is of Palladian, or Venetian Italian character in the details. There is a square tower at the end, rising from the ground. The upper stage of this is not in good proportion. The tower is surmounted by a square domical roof-covering of zinc laid in "fish-scale" pattern. A central court to the building is laid with white Dutch tiles. The offices are lined with carved oak throughout.

A new building for the St. James's Club is being completed at the corner of Dorchester-street and University-avenue, and occupies an area of 68 feet by 62 feet, exclusive of bay windows. It is a commodious building. The architects are Messrs. J. W. Hopkins & F. Lawford. The details are of Italian character. The upper of the two stories has the walls of red brick. A curved sided and flat-topped roof completes the design. A view of the Victoria Skating Rink, which has a roof of semi-circular arched principals, appeared in the Exhibition of 1862. The height is called 50 feet; so that the span would be 100 feet, without the side passages. Messrs. Lawford & Nelson were the architects.

THE CATHEDRAL AND TOWN OF AVILA, SPAIN.

THE following sketch of the cathedral and town of Avila, in Old Castile, may interest some readers:—

A railway ride through Old Castile is anything but interesting. Fancy England denuded of its trees and grass; fancy every brook and river to flow through a broad, shallow bed, in summer almost dry; fancy all the scattered houses of the villages and small towns collected into a group upon hills of reddish-brown sandstone, at whose feet long rows of black poplars beside a dry river indicate the promenade, or *paseo*;—fancy all this, I say, with a universal hue of dirty brown over all, and you will have a fair idea of Old Castile. Still, notwithstanding unfavourable appearances, there is much to interest a traveller in these same dull-looking towns. All, indeed, have something to show, some church or convent containing a majestic sculptured altarpiece or *retablo*, some beautifully-carved and inlaid stalls or cunningly-wrought iron railing, some cloistered court or ornate frontal, which well repays the trouble of the journey. The small city of Avila is situate at the foot of the Guadarraria, in a country of immense granite boulders and sparse vegetation, where grow a few small trees: a great improvement, however, on the flat country left behind, while the grey of the granite rocks seems quite a relief after so much brown. The walls of the town present a most striking appearance, with their circular turrets at intervals, and bold machicolated gateways. The cathedral has not much to recommend it outwardly, it having but one tower, like most Spanish cathedrals, and that more curious than beautiful; while the west entrance is disfigured by that vile rococo called by the Spaniards *churriguresco*. The view on entering is, however, most impressive. The screen, or *trascoro*, which, as in all Spanish cathedrals, obstructs the nave, is here sufficiently low to allow the whole length of the vaulting to be seen. The ribs and capitals of the vaulting shafts are gilt, but not too profusely; and the crown of each compartment of the vaulting is adorned by painting in subdued colours. I do not think the nave, which is the most modern part, can be later than the end of the twelfth century; for though the arches are Pointed, the capitals are Romanesque in form and detail, while the bases are almost Roman. The variety of capitals is something wonderful—there are no two even similar to each other: animals and monsters of every conceivable shape and in every conceivable position; foliage, sometimes Gothic, sometimes mocking the acanthus or twisting into the Ionic volute; while some have the plain forms of our earlier Norman capitals.

The choir appears older. The arches here are round and without mouldings: the triforium, formed of large arches inclosing two smaller, with a small column in the centre, is painted in chaste patterns, somewhat similar to the Romanesque churches of the north of Italy. The most singular thing about the east end is the double aisle surrounding it; the narrower arch being stilted to the height of the wider, while the round granite column in the centre is tied to the wall by a slab of the same material. The colour, red and grey, in the same block, of the stone of which the choir is built, gives it a singular and pleasing appearance: indeed, so much did the Spaniards like the look of it, that they have in the cloisters daubed the stones with patches of red in a vain attempt to imitate it. Though there is no really Moorish detail about the building, there is a Moorish sentiment which can be *felt*, produced by the stilting of the arches and the forms of some of the capitals. An artist might employ himself for months sketching the richly-carved tombs, the painted glass, and grotesque capitals. Some of the early Gothic tombs are far superior to anything of the same date which we have in England; those in the first chapel to the left on entering at the west, and those in the south transept, are particularly good. The painted glass is by one Juan de Santillana, 1498. The transept aisle being narrower than the first bay of the nave gives rise to some curious vaulting. The cloisters are simple, of the thirteenth century, but disfigured by the filling up of the openings, and by the daubing of red paint spread over them. From them entrance is obtained to a chapel with florid fifteenth-century vaulting. One of the windows alone has real tracery, and is of later date; the others are all pierced with an elaborate arrangement of circles, quatrefoils, &c., without mouldings. Outside, there is one good Gothic entrance of the same date as the window just mentioned; the pinnacles are simple pyramidal masses; the flying buttresses massive and without mouldings; the cresting of the only tower (apparently of the thirteenth century) is very singular; but what forces itself most on the attention is the prevalence of a hollow moulding filled with a row of ball-flowers: it surrounds almost all the windows, and forms the cornice both of the nave and circular apse. The bosses, as at Saragossa and elsewhere, are large rosettes covered with gilding. The "trascoro" is a fine work of the Renaissance period, with very beautiful reliefs; there is also a Renaissance tomb with a sitting figure, well carved, of Alfonso Joslado de Madrigal, a learned bishop of Avila. Opposite this tomb, which is in the aisle round the apse, stands the old altarpiece, with Early Gothic paintings. The present altarpiece fills up the whole height of the choir, and was painted with subjects from the life of Christ by Bevruguete, the famous Spanish sculptor and painter, a pupil of Michel-angelo.

Murray gives the date 1350 for the later work of the transept, and that of 1107 for the remainder of the church: if so, however, its building must have extended through a considerable period, as there is a perceptible difference of style between the choir and nave, and it is easy to perceive where the later part commences.

The church or basilica of San Vicente is both beautiful and interesting, being built, both externally and internally, in the same style as the choir of the cathedral. The windows have mouldings of massive members, and a billet moulding of very minute parts. The two principal entrances are deeply recessed with several bold ranges of mouldings, among which the chevron is prominent. The church is triapsal, and there is a low central tower, giving to the east end an appearance not unlike the churches of Auvergne. The exterior is undergoing restoration, and, strange to say, very judicious restoration, in the same style, the architect being one Autres Carrejo, of Salamanca. There is a portico of much later date round part of the building. The interior is scarcely inferior to that of the cathedral. The triforium is exceedingly beautiful, with its slender columns and bold-spreading capitals, in which the same variety of detail can be noticed which renders so great a charm to the cathedral. There is a crypt beneath the choir; but any originality it might have once possessed is completely hidden by whitewash and tinsel altars. The church is said to have been built by a converted Jew,—converted by a miracle at the martyrdom of St. Vincent in 303; but that must have been a previous erection on the same spot. Again, the date 1313 is given for the present edifice, but is evidently much too late, as its architecture cannot be more recent than the twelfth century. The tomb of St. Vincent is of the fifteenth century. There is a great deal more to interest in Avila than is here described, as my stay there was too short to see all, and I could not enter the Dominican convent, said to contain much that is beautiful. The great charm of the buildings at Avila is that they are little disfigured by recent additions, and are entirely free from the abomination of whitewash, which destroys the effect of Toledo and most other cathedrals in Spain.

W. N. LOCKINGTON.

THE LATE MR. W. C. MYLNE.

STILL another honoured name is added to the number of the members of our profession whose decease we have had, as lately, to record, and of whom the loss will be greatly felt. Mr. W. C. Mylne, best known as the London engineer to the New River Company, but also an architect, and a member of a distinguished family of architects, died on Christmas-day at his residence, Amwell, Hertfordshire, in the 83rd year of his age.

The late Mr. W. C. Mylne was the son of the celebrated Robert Mylne, the architect of Blackfriars-bridge, who was himself one of a line of men attached to the same calling, commencing in Scotland not later than the sixteenth century. In the Architectural Exhibition in Conduit-street, last year, three views in one frame were exhibited by the present Mr. R. W. Mylne, of steeples in Scotland, belonging to the same class as the Newcastle-upon-Tyne and St. Dunstan's-in-the-East examples. With two or all of these, the name of a Mylne was in some way connected. The steeple of St. Giles's Church, Edinburgh, is said to have been restored and partly rebuilt in 1648, by a John Mylne who was King's principal Master Mason. It appears there was a John Mylne in 1587, engaged upon the Dundee harbour and town works, and about the same time upon Lord Bannatyne's house at Newtyle; and he, in 1600, built the bridge of eleven arches which crosses the Tay at Perth. If this John Mylne were the King's Mason named above, he must have lived, like the last deceased of the family, to a good age. There was a Robert Mylne, King's Master Mason in Scotland, in 1671. He constructed Holyrood Palace and many other works.

Robert Mylne, the celebrated one of the name, was born in Edinburgh in 1734. He went to Italy early in life; and he was elected a member of the Academy of St. Luke at Rome. He could not have been more than five-and-twenty years of age, when the competition of designs took place, for the erection of a bridge across the Thames at Blackfriars. His design was chosen, according to the statements in some encyclopædias, out of twenty that were sent in; but,

according to the valuable "Biographical Sketch" of John Gwynn, by Mr. Wyatt Papworth, in our last volume (p. 455), there were upwards of fifty plans and models submitted on the 1st of November 1759; and out of that number, eleven were selected for further consideration,—these including, as stated in January 1760, a design by "Mr. Gwynn, known by his drawing of the section of St. Paul's," and one by "Mr. Milne, who finished his studies in Italy." Out of the eleven, three were selected. One of them by Gwynn had semicircular arches, whilst Mylne's had elliptic arches. A controversy ensued, of which mention is made by the writer of the "Biographical Sketch," who refers to a long account in the "Life of Dr. Johnson" by Sir John Hawkins. Johnson took up a defence in favour of his friend Gwynn, of the principle of semicircular arches against elliptic. Mr. Smiles, in the first volume of his "Lives of the Engineers," has a slight reference to the dispute, and says that Mylne was the first to introduce the elliptic arch. Mr. Papworth says, alluding to Mylne's project,—"The approved design was submitted to eight of the leading scientific professors of that day; who reporting favourably on the principles displayed, it was eventually adopted and executed." Boswell, in his "Life of Johnson," writing after trial had been made in the bridge, defends the design of Mylne. The bridge was commenced in 1760, and was finished in 1769. The foundations unquestionably were defective in the original provisions and building, or beyond the insufficiency of depth adequate to protect them against future scour of the river. The difference between the total bearing surface of the heads of piles, and that in Waterloo Bridge or London Bridge is considerable. Nevertheless Mylne was entitled to rank as an "engineer," interpreting the designation as now accepted. He combined the practice of the architect and the engineer in his own case; and the example has been followed by his descendants. The studies at least, ought always to be combined. At the date of the building of Blackfriars Bridge, however, there could be no question of the profession to be entrusted with bridge-building: the only one in the eleven names that would be claimed now by engineers as belonging to their branch of the profession, is the name of Smeaton; and he, were the Eddystone lighthouse to be taken as evidence, had more of the architect, and of the sense of the beautiful with him, than belongs to many who are called engineers now. The rest of the projects for Blackfriars Bridge, without reference to Gwynn's, included designs by Chambers, Ware, and Dance. Robert Mylne was surveyor of St Paul's Cathedral. He it was that suggested the celebrated inscription in memory of Wren. He was engineer to the New River Company. He seems to have been engaged to report on many engineering questions, as those of the conservancy and navigation of rivers. One of the reports, of which the title is before us, dated 1791, relates to the course of the Thames between Lechlade and Day's Lock. The date of his death is given in the Encyclopedia Britannica, 1821; but the date May the 5th, 1811, in other biographies, we have no doubt is accurate. The latter date would place his death in about the 77th or 78th year of his age.

William Chadwell Mylne, was the son of the Robert Mylne just now noticed. His second name is generally taken as having originally had allusion to the Chadwell springs of the New River: but we should not assume so much, as of necessity. He was born on the 5th of April 1781. We have few particulars of his youth and early education, further than a suggestion that he had not at first been intended by his father for the engineering or architectural profession. He however had from the nature of his father's works, early association with engineering. In 1797, we find him assisting to stake out the lands purchased for his father's great scheme of the Eau Brink Cut at Lynn; but which came to a standstill, until Rennie, in 1817, secured the necessary capital and executed the work. He succeeded his father as engineer of the New River Water-works, in the year 1811. This gave the main bent to his career, although he designed and carried into execution one church and other buildings, and was extensively engaged as a surveyor and valuer.

At the date of his appointment by the New River Company, the only water-works at the north side of the Thames, were those of this company, the London Bridge Water-works, and the Chelsea Company's Works. Thenceforward, Mr. Mylne's name is associated with the water-supply of London, as with that of numerous towns in the country, and of some places abroad. Whether, at last, and notwithstanding his competence to advise,—and little doubt that we have that advice was tendered by him,—some improvements came to be *required* to be forced upon the companies by the public, the press, and Parliament, we are not called upon now to examine,—more than we are, in this place, to show, as we have urged often, that others remain to be effected.

In his capacity as engineer to the New River Company, he recommended and carried into execution in their district, between Charing-Cross and Bishopsgate-street, the conversion of the numerous wooden mains and service pipes of Sir Hugh Myddelton's time, into cast-iron. This substitution, and other works, which, including engines, allowed of service at a higher level than the Clerkenwell reservoirs, are said to have cost a quarter of a million sterling. In consequence of the purchase by the Company, of the water-works connected with Old London-bridge, a powerful steam-engine, by the terms of the agreement, was erected at Broken Wharf, Thames-street, to take water from the Thames in case of accident to the New River. This was used only occasionally, during extreme drought or frost, and has since been wholly removed. The suction-main was 33 inches diameter, being then considered large in cast-iron. About the year 1828, he constructed 50 acres of settling-reservoirs at Stoke Newington, with a steam-engine for raising the water to a higher level, for the better supply of the upper and outlying districts on the northern side of the metropolis. In 1850, we find him giving evidence before the Metropolitan Sanitary Commission of the General Board of Health, on the supply of water to the metropolis. He had then been in office about forty years. His evidence shows that he was favourable to the use of 4-inch tubular drains, and of 6- or 9-inch branch sewers with proper inclination, and to the abandonment of cisterns and tanks, and resort to the constant supply for dwellings of the lower classes,—but for these only, and albeit perceiving the difficulty of carrying out the changes, if in connexion with the then existing arrangements of the Company.

In compliance with the Act of Parliament of 1852, the reservoirs at the New River-head were converted into filter-beds. From these the lower districts of London obtain their supply, whilst the upper districts obtain theirs from the mains under pressure of steam-power, and from the reservoir in Claremont-square, into which the water is raised by pumping. This reservoir was deepened; and it was arched over to keep the water from being contaminated by the atmosphere and London dirt, and thus from one of the great evils of the previous system which the Act had to meet. Other reservoirs were erected about the same time, and covered over, at Highgate, into which the water was pumped by steam-power. Extensive filter-beds were constructed at Stoke Newington in connexion with a large pumping establishment, whereby the upper districts of the metropolis are now supplied with filtered water. Other filtering-beds have been constructed at Hornsey; and the New River has been shortened several miles, by cutting off much of its circuitous course; whilst the remaining portions of it have been deepened and improved to the spring-head at Chadwell, near Ware. The connexion with the river Lea has been altered so as to yield a larger supply of water than formerly; and the drainage of the town of Hertford, above the source from whence the supply from the river Lea is taken, has been removed, and so prevented from contaminating that part of the stream.

The several works following the Act, are said to have cost the company three quarters of a million sterling. For some of these particulars, we have to acknowledge assistance from Mr. John Murray, civil engineer, who was a pupil of Mr. Mylne; and from Mr. Forrest, the active secretary of the Institution of Civil Engineers.

During the period of his association with the New River Company, Mr. Mylne was engaged in numerous works unconnected with the Company; and he furnished many able reports. These related as well to drainage as to water-supply. In the Fen district he was much occupied. He carried into effect works of improvement in the river Ouse, between Littleport and Ely, and others on the river Cam, and the drainage of Burnt Fen and the country adjacent. He reported on various works on the south level of the Fens. Amongst his reports were one on Lynn Harbour, one on the banks of the river Ouse, and one (dated 1825, in conjunction with Mr. Walker) "in consequence of the late intended Eau Brink Act," addressed to the Corporation of Bedford Level and Commissioners of Eau Brink Drainage.

Amongst his works was the intercepting drain at Bristol, by which the sewage was removed from the floating harbour. He made designs for the suspension bridge at Clifton, also for piers at Portishead at the mouth of the Avon, for the mail-packets. His reports include several on proposed docks, besides the works at Lynn and Bristol,—as at Liverpool, and Sunderland; and from his position and reputation, his evidence was frequently sought by commissions and parliamentary committees.

In 1847, Mr. Mylne and Mr. H. B. Gunning, as "surveying officers" under the "Act for making preliminary Inquiries in certain Cases of Application for Local Acts," conducted several inquiries, and reported to the Commissioners of Woods and Forests, as on the Leeds Water-works Bill and the Leeds and Thirsk Water-works Bill, the Rochdale Water-works Act Amendment Bill, a bill for Darwen, and possibly, other proposals. Mr. Mylne was consulted upon the Glasgow old Water-works; and, upon Mr. Rolfe's scheme for the Birmingham Water-works, he gave a detailed report with estimate. There was also a project for the supply of Paris, which we believe went to some length, and wherein the present Professor Donaldson was associated with him. Mr. Mylne also had something to do with the supply for Greenwich Hospital.

As surveyor to the New River Company, he laid out their property, near Islington, for streets and buildings. The ground has been some time appropriated as he proposed. He designed and superintended the erection of St. Mark's Church, Myddelton Square, which is Gothic, and some other buildings in Clerkenwell. For the University of Cambridge, he designed and superintended the erection of Gerrard's Hostel Bridge over the Cam. It was erected by the Butterley Company. Illustrations of it will be found in Hann and Hosking's book on bridges.

Mr. Mylne, besides the important office for the company so often named in this notice,—an office held by him for half a century at least,—was during the same time, surveyor to the Stationers' Company. As a valuer, he was employed by the Crown, in connexion with the improvements in the Strand.

Mr. Mylne was for upwards of fifty years, treasurer of the Smeatonian Society of Civil Engineers. On the anniversary, in 1862, of his appointment, a dinner was given to him by the members. He joined the Institution of Civil Engineers only on the 28th of June, 1842; but in 1844, he was elected on the council, and served office five years, or inclusive of 1848 and the previous date. Mr. Mylne was also a Fellow of the Royal Society, as well as of the Institute of British Architects.

Two or three years before his death, he had retired from professional life; but just a century after the building of his father's bridge, he had some gratification in seeing a design by his son, for a new bridge at Blackfriars, selected as one of the five that were reserved for further consideration. His estimable qualities and high professional character have made his loss regretted by numerous friends. He is said to have been the representative of at least eight consecutive generations of architects, or men filling a similar office, of the one family.

OPENING OF THE ATLANTIC AND GREAT WESTERN RAILWAY, BETWEEN CLEVELAND AND NEW YORK.

IN November last this railway, part of which is soon to connect St. Louis and Cleveland with New York and Boston by a continuous railway track of 6-feet gauge, was opened with great *eclat*. The figures of the road, its branches and "broad gauge" connexions, are as follows:—Main trunk from Salamanca to Dayton, 387 miles, and 60 miles additional from Leavittsburg to Cleveland. Branches: from Dayton to Cincinnati, 60 miles; Old Creek-road, 55; Leavittsburg and Youngstown, 17; Hubbardstown, 12. "Broad gauge" connexions: New York and Erie from Salamanca to New York, 414 miles; Ohio and Mississippi, 360; from Fishkill to Boston (now under negotiation), about 240. When, therefore, the main stem of the Atlantic and Great Western Railway is completed, which will be by the opening of the next year, there will be a continuous "broad gauge" road from St. Louis to New York, 1,201, and from St. Louis to Boston, 1,441 miles in length. Mr. T. W. Kennard, to whom

the undertaking was entrusted, began operations in 1860, in which year he built the 60 miles from Salamanca to Corry. The war then stopped the spade, and the works were not resumed until May, 1862. Between that time and January 1, 1864, twenty months, Mr. Kennard will have built and stocked 500 miles of road. To do this he has imported from Canada and Europe 15,000 men. None of the work, since the resumption, has been done by men living on the line of the road. All of it, too, has been done by the day. No contractors have intervened between the proprietors and the operatives. Mr. Kennard's assistants have been Messrs. John H. R. Rose & Clinton Coleman, assistant engineers; Daniel B. Bostwick, superintendent of bridges, timber, and stations; and Wm. Lee, superintendent of construction. Mr. J. Wrey Mould, of New York city, architect, furnished the designs for some of the structures built by the company.

At the dinner, which took place after the opening, the president, Mr. W. Reynolds, proposed, "The alliance between Great Britain and America, the best security for the peace of the world," which was warmly received.

Mr. Mason, in proposing the health of Mr. Kennard, said the railway "had been accomplished by English enterprise,—six-sevenths of it with foreign capital, and substantially all of it by imported labour. Nine thousand labourers from Canada alone were distributed along its line. I express myself in terms of prudent moderation when I say that the enterprise, energy, and ability which have thus speedily accomplished this undertaking challenge our unqualified admiration. But, in awarding to its promoters the just measure of honour, let me remind you of the extraordinary circumstances and difficulties under which the enterprise was resumed and prosecuted. Four hundred miles of this line and branches will have substantially been constructed within two of the years of the great rebellion. It was the iron of English product that was used in the construction of this commercial and national ligament. Her manufacturers sent it to our shores, not in the shape of hostile iron-clads—'take any other shape but that'—but they furnished it to build us together by stronger ties, and to bind us to England by commercial intercourse."

Mr. Kennard was received with great warmth, and, in responding to the toast, took occasion to thank the various members of his staff.

General Rosecrans was present. Good feeling towards England was the order of the day.

THE THREATENED DESECRATION OF BUNHILL-FIELDS BURIAL-GROUND.

IT appears to be threatened that Bunhill-fields Burial-ground will be disposed of for building purposes. Already several of the metropolitan burial-grounds have been desecrated, grave-stones and other memorials have been removed, and in some instances the remains of the dead carried away by wholesale. In all cases the desecration of graves is a matter most offensive to right feeling, not to mention the danger and unwholesomeness of planting dwellings on soil which is composed of the bodies of the dead. Besides, it is a most unjust act, for comparatively enormous sums have been paid for the freehold of vaults and ground.

Since the time of the Great Plague, two hundred years ago, Bunhill-fields has been until lately the chief place of interment in the metropolis for Dissenters, and many of their leading men lie there. Besides, it is here that Daniel De Foe, John Bunyan, and Isaac Watts lie buried. Surely these great names alone should be sufficient to prevent the desecration which is threatened.

In this ground, during two centuries, countless thousands of the dead have been laid, until the earth has been raised considerably above the original surface. The land has been paid for again and again. In whatever way this matter may be considered, it is clearly seen that to dispose of this place for building on would be an act disgraceful to the great Dissenting community. It will, however, be said that the place is private property, and that those to whom it belongs may do what they like with their own. It is not their own: we repeat, the ground has been purchased again and again, on the understanding that the human ashes here deposited would be allowed to remain unmolested.

If some of those who have vaults here, and have purchased the right of burial, were to appeal to a legal tribunal, an injunction against the removal of their property would be readily obtained, so that the proprietors would be unable to sell the ground for building sites without an Act of Parliament; and it is not probable that any measure would be allowed to pass through the House of Commons for the misappropriation of a spot which, besides other associations, contains the graves of the authors of "The Pilgrim's Progress" and "Robinson Crusoe."

SANITARY INSPECTION IN CLERKENWELL.

IT is satisfactory to find that the sanitary committee of this parish have been making a round amongst some of the neglected parts. In some instances their attention has been directed to particular localities by the Commissioners of Police, in consequence of the reports of the officers of Mr. Reason's staff. At Bishop's-court the committee were satisfied with what had been done. They viewed Berkeley-court, in accordance with the direction of the vestry board, on the medical officer's report relating to overcrowding and the occupation of cellars. The committee reported that, though the cellars were occupied, they did not seem to be so overcrowded as to call for action. On the discussion of this point in the vestry, it was very properly remarked that cellar dwellings are as illegal as they are unwholesome. Upon remonstrance, this matter was proposed to be referred back to the sanitary committee for re-consideration; but the proposition was opposed, and led to some discussion, on which, after we have taken an early opportunity of examining the state of these different premises, we may remark at more length.

Eagle-place was viewed before, and the owner required to fulfil several sanitary requirements. Nothing, however, was found to have been done, and the committee resolved that the owner be proceeded against. Broad-yard was found not to have been attended to, and it was resolved that the owner be summoned before the magistrates.

Respecting Fryingpan and Bill alleys, parts known to our readers, communication had been made by the Commissioners of Police. The committee viewed them, and reported that, owing to the extremely careless and filthy habits of the people, nothing but absolute removal would improve the condition of these places. [The committee, while referring to the dirty habits of the people, make no reference to the state of the water-supply here.]

Wilmington-yard and Guildford-place were remarked upon; but the consideration of the matter was postponed.

HOUSE VENTILATION IN THE LIME-HOUSE DISTRICT.

A CASE of considerable importance has been brought before Mr. Partridge, the magistrate of the Thames Police Court, by Mr. Scott, the sanitary inspector of the Board of Works for the Limehouse district, in consequence of complaints which had been made of a house, No. 22, Angel-gardens. Mr. Scott stated that he had examined the house, and found the windows only movable at the bottom; the upper sashes were fixtures, but the house was perfectly clean. Mr. T. Orton, the medical officer of health of the district, said that typhus fever to a great extent had prevailed in Angel-gardens, particularly at No. 22. There were nine cases of typhus fever in that house, five upstairs and four down. These cases, as well as others in the same street, were caused by defective ventilation. The upper sashes of the windows could not be pulled down, and no current of air could be freely carried through the rooms. It was impossible to have perfect ventilation in the small houses of the district without the upper sashes of the windows could be opened for the admission of air. Mr. Orton observed that the mortality from typhus in St. James's, Westminster, had been seventeen; in Marylebone, twenty-seven; and in the Limehouse district, comprising Wapping, Shadwell, and Limehouse, seventy-seven. The medical officer remarked that the parishes of St. James and St. Marylebone were more densely populated than the Limehouse district; but the mortality in the first two parishes is much less, owing to the houses being better ventilated. He had letters from Dr. Letheby and Dr. Lancaster, and from the medical officer of St. Marylebone, all agreeing that the upper sashes of every house in the metropolis should be movable, and frequently opened. After an observation by the magistrate, Mr. Orton continued to observe, that in many houses the stench was so great that he could not enter them; the tainted atmosphere of the interior of the dwellings caused fever, and, consequently, the death-rate was greatly in excess of what it ought to be. He also mentioned that the sick poor frequently cried for more air; and he would say advisedly, that until the dwellings of the poor were better ventilated and the upper sashes of the windows constructed so as to let down when required, there would be no decrease of fever cases.

Mr. Rabey, the proprietor of forty-four houses in Angel-gardens, said that he had latterly put them into a state of repair at a vast expense, and the cost of altering the windows as desired by the Board of Works would amount to 25*l.* more; and he was of opinion that there was already plenty of ventilation; and, moreover, that ventilation did not prevent fever, instancing the deaths of three children from this cause of the secretary of the Limehouse Board of Works, in a house situate in an open road, with a garden at the front and back, and whose establishment was a large and commodious one.

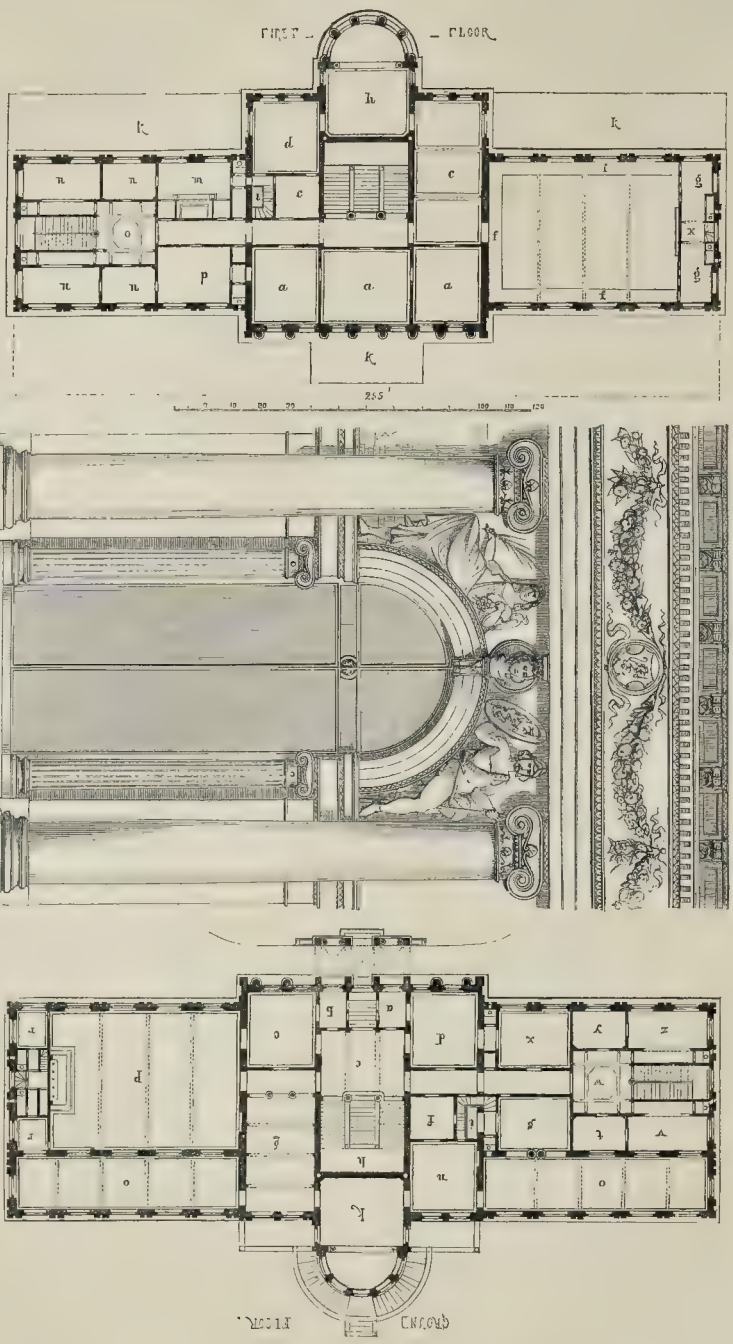
Mr. Orton, however, observed, that the cases referred to were scarlet fever, arising from specific poison, not from want of cleanliness or fresh air.

The magistrate thought that the defendant might alter the upper sashes of the windows in the manner required. Mr. Rabey said that he should have to alter the construction of every window if this were to be carried out; and Mr. Scott suggested a ventilation with movable hinges at the top of each window.

The magistrate considered altering the upper window-frames necessary, and adjourned the case for a fortnight, in order to allow the proprietor of this property to carry out the requirements of the Limehouse Board of Works.

THE METROPOLITAN POOR-BOXES.

IT is with regret we hear that the poor-boxes of several of the metropolitan police-courts are in a very low state, especially in those neighbourhoods where they do most good. Few of the London charities are more worthy of support than this, which is so admirably administered, and in a manner which almost prevents the possibility of imposition. Few except those who move amongst the distressed classes of this great population, can judge of the good which is done by means of this fund, which is not intended as a substitute for parish relief, but for the help of those who by some extraordinary or sudden emergency, are driven to distress. Thus the homes of deserving persons, some of them sick,—persons ill and discharged from the hospitals, have been saved from distraint, &c. Some have been supplied with necessary clothing, or with tools for their work; young girls on the brink of ruin, sent in safety to their friends; in extreme cases, assistance given for the purpose of burying the dead. Fifty other matters might be mentioned which have come to our notice, to show the great value of this means of relief; but we believe that it is simply needed to be made known that at this season of the year some of these boxes are almost empty, to ensure their speedy replenishment.



"ST. PAUL'S CHURCHYARD."

WHY is the *north side* closed against carriage traffic? The carriageway there is the most direct line from Ludgate-hill to Cheapside. Then let it take its natural course, leaving the southern side free for Cannon-street traffic. For years there has been a cry for a new street between St. Paul's Churchyard and Newgate-street. Why not utilize the existing thoroughfare? Widen the street where necessary by throwing in a portion of the churchyard. Double-glaze the windows of the cathedral, if the noise be complained of; but give a chance, at any minor sacrifice, for the congested traffic, now forced to take one route only, finding for itself a vent in two directions.

The carriageway runs close to the southern portico—why, then, may it not run equally close to the northern? NOT TOO LATE?

PHOTOGRAPHIC PROGRESS.—A Mr. W. S. Shirras, of Aberdeen, is busy transferring photographs from paper to china, as a new discovery. That photographs had already been transferred to glass is well known, but we rather think the transfer to china itself is not quite new.

PALACE OF T.R.H. PRINCE AND PRINCESS LOUIS OF HESSE.

DETAIL OF FIRST FLOOR WINDOW.

PALACE OF T.R.H. PRINCE AND PRINCESS LOUIS OF HESSE, IN DARMSTADT.—DESIGNED BY MR. CONRAD KRAUS, ARCHITECT.

THE PALACE OF T. R. H. PRINCE AND PRINCESS LOUIS OF HESSE, DARMSTADT.

A PALACE is being built in Darmstadt, a description of which cannot fail to be of interest to our readers, as it is destined to become the home of a member of the Royal Family.

It is the Palace of their Royal Highnesses Prince and Princess Louis of Hesse. The new building will form a prominent feature in the town of Darmstadt by its size and position. The site (a large garden of 350 feet by 1,500 feet) is the property of the Crown; it was formerly used for botanical purposes, and will now be laid out as a garden for the use of the Prince and Princess. The east end of the site faces the Wilhelminenplatz, a handsome square, with the Roman Catholic church, a cupola-covered structure, designed by the late esteemed architect Moller. To the west the garden extends to another square, called Marienplatz, while towards the north and south it is bounded by two broad streets, from which it is separated by rows of chestnut-trees.

Being, moreover, situate in the highest part of the town, with a gentle slope from east to west, this garden combines all the advantages of a site at once healthy and beautiful. The view from the first floor of the Palace, over the garden and the wide valley of the Rhine towards the hills of the Palatinate, the hills near Mayence, and the Taunus mountains, is truly charming.

The building stands at a distance of 120 feet from the east end of the garden. As it will be seen on referring to the plans, it consists of a principal or centre part and two adjoining wings; the back elevation, or garden front of the former, being enriched by a projecting rotunda, winged on both sides by terraces and flights of steps leading to the garden. The principal front, facing the Wilhelminen-square, has a projecting entrance-porch, constructed for carriages to drive under it, that visitors may alight under cover. This porch forms a spacious balcony, with a balustrade on the top.

On entering under this porch, we reach the entrance-hall and principal staircase, 52 feet by 32 feet, the latter being approached between columns of the Ionic order. The centre flight of steps is 12 feet, and the two upper flights are 10 feet wide. The staircase and hall are lighted by a large skylight, with a stained glass cupola beneath. The ceiling round the cupola will be richly decorated. The principal staircase is of black Belgian marble, polished, and is decorated with a rich bronze balustrade. The height of the ground-floor, as well as of the principal floor, is 20 feet.

The ground-floor contains,—

a. Waiting-room.
b. Porter's lodge.
c and h. Entrance-hall and principal staircase.
d and x. Reception-rooms and study of H.R.H. the Prince.
l, n, and s. Ante-rooms, reception-rooms, and boudoir of H.R.H. the Princess.
k. Library and billiard-room.
g. Dining-room.
e. Reception-room.
p. Ball-room,* 32 feet by 68 feet.
o, o. Promenade galleries, or loggie.*
r, r. Visitors' toilet-rooms.*
v, t, z, y. Gentlemen's rooms and offices.
w. Vestibule and staircase for ladies and gentlemen in waiting.

The principal floor contains:—

a, a, a. Spare saloons.
c. Music saloon.
f, f. Galleries of ball-room.
g, g. Visitors' box and orchestra.
x. Servants' staircase.
h. Boudoir and conservatory of H.R.H. the Princess.
d. Bed-room.
i. Their Royal Highnesses' private staircase.
m. Dressing and bath room of H.R.H. the Princess.
e. Dressing-room of the Prince.
p. Study of the Prince.
n, n, n, n. Spare rooms.
o. Vestibule.
k, k, k. Balcony and terraces on the top of entrance-porch and loggie.

The plan of each floor is arranged in such a manner that the whole of the private apartments can easily be separated from the other parts of the building by closing the two doors of the corridor, so that visitors and ladies and gentlemen in waiting may use the staircase at the further end of the left wing, by which arrangement the ease and comfort of the private apartments are left undisturbed. In the third story are the nursery and visitors' rooms, saloons, and bed-rooms of the ladies in waiting. In the right wing, above the ball-room, are the female servants' bed-rooms and wardrobes—the latter part of the building being in communication with the basement story by back-stairs, for the use of servants and musicians only. The basement floor includes the bath-rooms, store-rooms, servants' hall, kitchens, larder, scullery, pantry, still-room, housekeeper's, butler's, cook's, and steward's apartments, the footmen's bed-rooms, and the usual domestic offices which the comfort of a royal dwelling requires.

There is a wine-cellar beneath the basement floor.

The walls of the building are constructed of brickwork. The rusticated plinth, the columns, the archivolts, the architraves, and cornices are of red sandstone from the quarries of the Odenwald and the banks of the Main. The decorative parts of the cornices, as dentils, &c., the capitals of the columns and pilasters, the balustrades, the sculptured frieze, having medallions with trophies and other suitable emblems, and the festoons, are executed in terra-cotta.

Of the external decorations, the rose, shamrock, and thistle, the Hessian arms surrounded by the garter, and the English arms, will form characteristic and ornamental parts.

The style is Italian, and more purely carried out than is usually the case on the Continent. We give an illustration on a larger scale of one of the seven arches of the arcade of the principal floor, being of the Ionic order. The fourteen spandrels of this arcade are sculptured with life-size male and female emblematical figures, representing Germania, Britannia, &c.

The building is being executed from the design and under the superintendence of the architect of their Royal Highnesses, Mr. Conrad Kraus, of Mayence, and will be finished in the autumn of 1864.

* To be used on State occasions.

THE GOVERNMENT WORKS NEAR FAREHAM.

IN August last an inquiry was held at the Red Lion Inn, Fareham, to assess the amount of compensation which should be paid by Government to Mr. Whettam and his sisters for some land belonging to them, which was required for the defence of the realm. The jury assessed the compensation at 3,758*l.* 6s. The land, which was used as a brickfield and lime and brick burning works, had been for thirty years in the occupation of Mr. Whettam, brother of the owners, who, after having received the compensation, refused to give him notice to quit, and the Government, requiring that the land should be kept free from buildings, were compelled to do so. This they did on the 8th of September last, offering 200*l.* as compensation for possession of the premises, but the claimant would not accept it, and the Government therefore took steps to secure immediate possession. An inquiry accordingly took place at Fareham, before two justices of the peace and a special jury. Various evidence was led to show the produce and value of the brickfield to the tenant. The manager of claimant's brickyard said he had worked at the trade, as practical brickmaker, for over seventeen years. Occupied the waste ground, about 2½ acres, brick earth being under it. The good earth is 9 feet, the first 6 being thrown away. Should think the earth would last twenty years, according to present consumption. Had bored in six different places, and found brick earth at 25 feet, and then sand and loam. Both the latter can be used in manufacture. The average make of bricks per annum during the time he had been in the yard was about 400,000, tiles 100,000, and drain pipes about the same. The lime is about 50 quarters a week all the year. The numbers named do not represent the capacity of the kilns. More trade could be done.

Mr. James Whettam, the claimant, said, the number of bricks manufactured in two years was 634,500, the actual selling price being 25s., and the cost of production 17s. 6d. per 1,000. Had, as near as he could get at it, for the last three years, received 200*l.* net annual profit. The capital invested was 1,400*l.*

Mr. Johnson, in stating the case, said that the property was occupied by the claimant under his brother and sisters, at a nominal rent of 20*l.* per year, nothing like the real value, which would really be more like 60*l.*, 70*l.*, or even 80*l.*; indeed he believed it had been assessed to the poor-rate at a gross rental of 75*l.*

Mr. Hawkins, for the Government, submitted that the claimant had no legal right to the premises, and that he should be dealt with just the same as if he were an ordinary tenant. If he had received a notice at Michaelmas to leave, he must have done so at Lady-day next. He reviewed the evidence, and suggested that 150*l.* would be a liberal compensation.

After five minutes' consultation, the jury awarded 280*l.*

LONDON LIFE AMONG THE MILLION.

TENEMENTED DWELLINGS OF THE BETTER CLASS.

THE inconveniences and unpleasant circumstances of the chief part of the tenemented dwellings in the metropolis which are of a better description than those in Bethnal-green, and are inhabited by a vast multitude, can only be estimated by those who have had the unfortunate experience to reside in them. They are bad even to those who have been reared in such places; but to those who have been differently circumstanced, the evil is almost intolerable.

First, there is the feeling of a want of privacy, which is painful: there is an incessant wandering of feet, from early morning till late at night, up and down the uncarpeted and noisy wooden stairs common to several families: there is the thundering noise of children, &c., in the rooms above or the rooms below: a fender or a chair cannot be moved in one family without making a certain amount of annoyance to other families: the noise of the children seems never to cease: the voices of the women, well exercised in attempts to preserve order, are generally loud and shrill. Then there is the daily shooting of half-hundredweights and other small quantities of coals; disputations amongst the neighbours; the whirling, it may be, of two or three hired sewing-machines in one small room, and the thumping of shoemakers in the attics. In most of these houses there is one troublesome family, or even more: it may be that this is in a measure caused by the husband coming tumbling home drunk early on the Sunday morning, or on other nights late, when he is in a humour for expressing his ideas very unpleasantly. In this way children whose parents would be sorry to teach them anything wrong, hear language horrible to think of. There is also danger to all from such a fellow, and perpetual anxiety on his account; for fires have often been caused by such persons. We lately heard, for example, of a man coming home drunk late on a Saturday night, after which his wife was obliged to go to market for the next day's provisions: the children were asleep in bed, and the beast of a father and husband lay down on the floor, after placing the candle so as to set fire to the furniture. We mention this amongst the complaints in connexion with tenemented dwellings, which are built in the most inflammable manner, because our belief is that the risk in this way is greater than is supposed.

When we look at the accommodation, we find that, with the exception of the kitchens (which, as our readers know, are seldom fit for the habitation of a family), there are no arrangements for cooking,—no boilers, which are so necessary for the preparation of hot water, where there are young children; nor are there ovens, which at no extra cost, would enable managing housewives to prepare many a nice dish. With better accommodation such as this, instead of buying cooked meat at a price of nearly twice as much as it is worth, for the dinners of the men and boys who work at a distance,—pies and other tasty and nutritious dishes could be got ready, which would be far cheaper and better than what can otherwise be obtained.

Frequently the cupboard accommodation in these rooms is very scanty, and pots and pans have to be hidden under the beds. As for coals and wood, there is probably no other place than the bottom part of a closet, in which the bread and provisions must be kept;—persons thus being obliged, if even they can afford to do otherwise, to purchase small quantities of fuel, in general deficient both in quality and in quantity, and far dearer than it ought to be. The rent of such rooms, nevertheless, is large; and these and other items which might be mentioned, add materially to this outlay of families.

Where water is to be had in sufficient quantities, the women, who have large families, complain of the labour which there is carrying it up and down three or more flights of stairs: there is also dust, &c., to be carried away. The stairs in each house create difficulties: there are differences about the cleansing; and in one and the same dwelling it is likely that there will be some children kept clean and some dirty; some women who are slatterns, and others who pride themselves in having their rooms and everything about them perfectly clean, but who are thus liable to have their children poisoned by

the filth of indoor neighbours. The children, dirty or clean, escape out of the rooms, and crowd the stairs, causing, besides other risks, much confusion as well as noise.

To add to the incessant din within most of these houses, in which there are five, six, or more families, there is a constant noise without; for among these teeming populations numbers of small traders come, who, as is usually the case with those who have little to sell, make much noise; but it may be that even the more substantial of these dealers find it necessary to exert their lungs, for the purpose of making the exterior sound override that of the interior. But as regards the noises outside, from four to six o'clock in the morning there are discharged, by the door-knockers, thuds which sound like the reports of small pieces of ordnance: sometimes one, two, or three heavy strokes are fired off at particular doors, by policemen on the beat, who perhaps neglect their other duties in consideration of a small weekly stipend, for rousing persons to go to their early employment. This also awakens the smaller children; and in those places where poultry is kept, the cocks begin to crow and the ducks to cackle with tremendous violence, dogs to bark, and clamping feet to come down wooden staircases and along resounding passages, finishing off by the regardless slamming of doors; and there is but little pause ere the noisy opposition railway milkmen and their fellows begin to bellow, sweetly mingled with the musical reverberances of water-*cresses* and mild *Yaaarmit*. Following these come almost unbroken arrays of costermongers, mingling their rough notes together until about one o'clock, intermixed with the redeeming visits of organ-men, or occasionally a coarse brass band and a still coarser ballad-singer, or a street speaker stating his lugubrious begging case with an air and manner so well got up that he can only appear in his right aspect to experienced eyes. Between 12 and 2 crowds of boys rush from the National and other schools. It may be, however, that if this adds materially to the great noise of London, *it* is not a matter which Mr. Babbage or any other lover of repose would object to. The hideous combinations of sounds to which we have but briefly referred, however, must be hard for any one to bear.

If the arrangements of these tenemented dwellings are bad for the adults, they are infinitely worse for the children, who are usually situate as follows:—

It is seldom that the mothers, on week-days, can take the children out; as clothing for that purpose is often only availabe on the Sundays,—the pawnbroker being the costly wardrobe-keeper. If the mother be desirous of peace, the little ones, to whom air and exercise are as needful as food, are scarcely allowed to move; and in order to keep up this unnatural state of things, there is unceasing altercation between parents and young children. When it happens that the father is much engaged at home, it makes matters worse; for his authority, which should only be brought into exercise on serious occasions, is exerted at all hours, and about the most trumpery matters; and by these means the influences which should overawe children are weakened, and they grow up to be disobedient and uncontrollable.

The manner of shutting up children in rooms which are for the most part insufficient in superficial extent and in ventilation, without enough of exercise, dwarfs their limbs and impairs their faculties; but the dangers of the streets, where boys and even girls of all kinds—good and bad—can mix without reserve together, are even a greater social evil: there are hundreds now lodged in our prisons who can trace their downfall to the inconvenience of their homes, forcing them into the streets amongst bad associates.

Will the day be long distant when the working classes, and others of limited incomes, will no longer submit to live under those miserable conditions which we have briefly, and we fear imperfectly, described? The change must depend in a chief measure on these classes themselves; for when once there is shown a clear determination to have homes in which they can live in privacy, and in quiet and comfort, with their families, and not either be or suffer any annoyance in their association with immediate neighbours, they will speedily be provided. The writer has lately mixed with large numbers who live in some of the better-conditioned of the tenemented dwellings, and is glad to see that attention has been directed far more than formerly to those newly-planned houses where they can live in comparative safety in consequence of fire-proof construction; where the floors are noise-proof, and where every convenience for the use of a family is provided within their own particular set of apartments. In connexion with all future dwellings for the use of families, a playground for the children, where they could be kept under the eyes of their friends until old enough to go to school, should be considered a requisite accompaniment.

Having said this much, it is but fair to add, that the bickerings and feuds to which reference has been made seem to be mainly a consequence of the want of isolation, and other things needful for the especial use of one household; for in time of sickness and distress we have not heard complaints of the failure of kindly and neighbourly actions among the thousands of ill-housed Londoners.

THE GIPSY SPRINGS, YORKSHIRE.

THERE are on the Chalk Wolds of Yorkshire a number of remarkable springs bearing this name, and if not strictly ebbing and flowing wells, as those at Chapel-en-le-Frith, Derbyshire, they approach to them in their character of being intermittent.

These springs are of great volume, and extend over a district of several miles, and water the dale towns above Driffield, passing through Wold Newton, Rudston, Thorpe, and Boynton, and finally discharging themselves into the sea at Bridlington Quay. Although they supply several mills in their course, they entirely disappear in summer, and suddenly and in great volume reappear in autumn, and the stream is called by the villagers the Gipsy Race, from its sudden rise and rapid flow.

Some years ago a railway tunnel was cut through the Chalk Wolds, for the Malton and Driffield Railway, and it was supposed to have diverted the source of these springs, which have considerably diminished of late, and caused much inconvenience and drought on the estates through which these waters used to flow, more especially to that of Mr. Wentworth Bossville, of Thorpe Hall, whose ornamental waters, of over 10,000,000 gallons, were entirely dependent on these springs for their supply.

It was thought desirable to have the district surveyed by an engineer, to see if it were possible to regain the springs by making an outlet for them on a lower level. During the present summer this has been done by Mr. J. F. Fairbank, and we are told, a supply equal to 1,000,000 gallons per week has been obtained at Rudston, to the great satisfaction of the farmers and others in the neighbourhood, who suffer much during the summer season from drought in the parched-up chalk districts.

IRISH NEWS.

Re-opening of Down Cathedral.—This cathedral, which has been closed for the last three years while undergoing repairs and alterations, has now been re-opened. Internally and externally a good deal of labour has been expended on the edifice. The roof, tower, and walls have been repaired, and the pinnacles, which under the action of the weather exhibited symptoms of decay in several places, have been restored to their original proportions. Formerly the middle of the centre aisle was obstructed by a number of unshapely pews, for which have been substituted open seats, carved in front and at the ends, and varnished. In each of the aisles a new row of seats has been constructed along the walls, similarly enriched with carvings, and on the backs of some of them have been mounted shields with the crests and mottoes, carved in wood, of the families to whom they have been appropriated. The carving of the crests and mottoes was executed by Messrs. R. & J. Quaile, of Downpatrick. As regards the painting and varnishing, an unpleasant hitch occurred. The contractor failed to execute it in a manner satisfactory to the dean and chapter, who made representations on the subject to the Ecclesiastical Commissioners, who, after repeated remonstrances and solicitations on the part of the dean and the other authorities of the cathedral, as well as the bishop, finally complied, and the painting and varnishing were handed over to Mr. P. Ferguson, of Downpatrick. The features in the interior of the building which most arrest attention are the piers and arches which separate the centre from the side aisles, the forms of the piers being oblong, with the angles taken off, and ornamented on the east and west faces with semicircular shafts of cut stone, the capitals of which appear sculptured with figures of human heads, grotesque animals, and foliage. These piers, as well as the shafts and groins of arches and the vaulted ceiling, have been coloured with a delicate salmon tint. The alterations in the centre aisle impart a more spacious appearance to the interior; while the furnishing of the pews and open seats, and the brilliancy of the painting and varnishing, are an agreeable change upon the aspect almost of squalor which the old interior presented. The organ, as well as the building, has received many alterations and improvements. The organ work has been done by Mr. J. C. Combe, of Belfast, who has applied a pneumatic lever to act upon the great organ. The heating is accomplished by means of hypocausts in the crypt, from which pipes extending under the floor convey hot air over every part of the building; and in the nave are two ornamental stoves, faced with encaustic tiles, and supplied by Messrs. Musgrave Brothers, Belfast. The monumental brass erected in the vestibule to the memory of the late Dr. Brabazon has been retouched and polished.

Dublin.—The bequest of the late Mr. Drummond, amounting to 20,000*l.*, to found a school at Dublin for the education of children the orphan daughters of soldiers, has been securely established for the object intended by the testator. The amount of the bequest has been paid into the Court of Chancery by the executors, and a scheme for the future management of the charity has been approved by the Master in Chancery, printed, and circulated. The school will be managed, as nearly as possible, on the plan of the Royal Hibernian Military School for Soldiers' Sons.

Drogheda.—A circular has been issued inviting a meeting of leading citizens, to be held in the assembly-room in the Tholsel, to confer with the gentlemen to whom Mr. Benjamin Whitworth, of Manchester, made the offer of erecting a town-hall for Drogheda, and to appoint a committee to carry out his views.

Clanabogan.—The new church of Clanabogan has been opened for Divine service, by the Bishop of Derry and Raphoe. To Mr. Samuel Galbraith, the proprietor of the ground on which the church is erected, it is chiefly owing that a church and district have been obtained in the locality.

NEWS FROM SCOTLAND.

Albert Memorials.—At a meeting of the Edinburgh committee for promoting the Scottish National Memorial of the Prince, the report of the acting committee was read, and Sir William Johnston moved the following resolution:—"That the committee approve of the report which has been read, and record their thanks to the acting committee for their diligence in prosecuting the movement, instruct the honorary secretary to intimate to the acting central committee that the sum of 4,113*l.* 4s. 9d. has been collected up to this date, and to state that it will be satisfactory to the committee that a meeting of the acting central committee be convened upon an early day to consider the steps which should be taken for carrying out the proposed memorial." In supporting the resolution, Sir William said that they had just heard from the report that many people had refused to pay their subscriptions, and others who had sums collected in different towns were retaining them, and not sending them to the central committee, in consequence of the long delay that had taken place. Although he was a member of the central committee, he must say that this matter had given very great dissatisfaction to many parties; and he thought that very much of the grace of the honour to the Prince Consort had been taken away by the delay that had taken place. Every one complained of the delay, and yet no one could give a good reason for it. His Grace the Duke of Buccleuch had undertaken to ascertain the wishes of her Majesty—he questioned whether that should have been done at all—but as it was in March, 1862, that his grace had undertaken to do so, certainly there had been ample time for reporting the result to the committee. In every instance—he thought three at least—where her Majesty was asked to give an opinion upon a matter of this kind, her opinion had been disregarded, and he was very much afraid the same thing would take place here. They were restricted as to means, as they would not have more than 12,000*l.* or 13,000*l.*; and they were also very much restricted as to sites. He thought it was the duty of this meeting to urge upon the central committee the importance of taking immediate steps towards the completion of the proposed memorial. After some discussion the

resolution was unanimously adopted.——The citizens of Perth having resolved that their subscriptions should not be thrown into the Scottish National Fund, but devoted to the erection of a statue of the Prince in Perth, some time since commissioned Mr. William Brodie, R.S.A., of Edinburgh, to execute the work. The model is now nearly completed; and this is the first statue of the Prince by a Scottish artist. The statue itself will be colossal—at the least 8 feet in height—but the model is not full size, being about 5 feet high. The Prince is represented as attired in robes of the Order of the Thistle, his right foot slightly advanced, his right hand leaning on a square pedestal, and displaying a drawing or elevation of the Great Exhibition building.——The *Dundee Advertiser* says the committee of the Albert Institute have received subscriptions to the amount of 14,850*l.*, and Sir David Baxter has intimated that whenever the general public make the subscription 17,000*l.* he will become responsible for the remaining 3,000*l.*

Edinburgh.—A bust of Lord Cockburn, by Mr. Steell, the sculptor, has been placed in the great hall of the Parliament House, by desire of the committee of subscribers.

Additions to the Royal Pictures at Holyrood Palace.—Several valuable additions to the collection of royal pictures at Holyrood, Edinburgh, are about to be made by command of her Majesty, from the large collection at Hampton Court, where there are a good many duplicate portraits of royal personages connected more or less directly with Scottish history.

An Edinburgh Cooking Depot.—A few days ago Prince Alfred and Prince William of Hesse paid a visit to the Ulbster cooking depot for the working classes, established by Miss Catherine Sinclair, at Queensferry-street, Edinburgh. The Princes, without being recognized, entered the crowded dining-hall, and were served with the usual 4½*d.* dinner supplied to frequenters of the depot. After dinner, they visited the kitchen of the establishment, and before leaving expressed their entire satisfaction with all the arrangements. The depot is self-supporting, and is visited by about 500 persons daily.

Glasgow.—The Lansdowne United Presbyterian Church, on the Great Western road, near the banks of the Kelvin, has been opened for Divine service. The designs for the edifice were furnished by Mr. Honeyman, of this city, architect. The building will accommodate nearly 1,100 persons. The arrangement of the pews in the area is unlike any other church in this neighbourhood, except the Free West Church in Greenock, by the same architect. There is only one passage in the centre of the area: half of the pews enter off this passage, while the rest enter off spacious side corridors extending along at each side outside the main walls of the church. The doors of these side pews, when closed, form a continuous panelling on each side, finished above with a timber cornice. The side corridors communicate with the front vestibule, which is 12 feet 6 inches wide, having the entrance door in the centre, and a door of egress at each end. There is also a door of egress at the east end, and a separate door for the use of the minister. The side galleries are only 6 feet wide, and are carried on iron brackets, thus obviating the necessity for iron pillars except at the transepts where the galleries are wider. The ceiling is almost semicircular in form, and the height from the floor is 54 feet. The three windows of the apse behind the pulpit are filled with stained glass by Messrs. Ward & Hughes, of London. The design is mosaic, surrounding medallions, containing figures emblematical of the law, the prophets, and the gospel. The extreme length of the interior, including the apse, is 100 feet. The height of the spire, which stands at the south-east corner of the building, is 218 feet. The building immediately to the east of the spire, having a high gable towards the Great Western road, contains on the ground-floor a session-house, ladies' room, vestry, and other apartments, and upstairs a hall, capable of accommodating above 300 persons; there is also a beadle's house and offices at the north side of the church. The style of architecture is Early English Gothic, of an ornate character, carving being freely introduced. The cost of the whole of the buildings, including a large unexpected outlay on foundations, and the cost of retaining wall forming new street between the church and the Kelvin, amounts to about 9,700*l.* The contractor for the mason work was Mr. J. Coghill, and for the wright work Mr. J. Morgan: the inspector was Mr. J. Kintrea. The special collection made at the three opening services on behalf of the building fund amounted to 1,230*l.* 8s. 2d.——The sum of 18,000*l.*, which is to accumulate at compound interest for twenty-one years, has been given by Mr. George Baillie, the eldest member of the Faculty of Procurators in Glasgow, and formerly Sheriff-Substitute of West Perthshire, for the establishment and maintenance of free libraries and public schools in Glasgow.

Denny.—We learn from the *Falkirk Herald*, that scarlet fever, of a malignant character, prevails in this town, and in the neighbouring village of Dunipace. It is now several months since this epidemic appeared in the district, and during that time the death rate has been largely increased. As yet there is not the slightest appearance of the disease abating. Few families have escaped, and many households have lost one of their number, several two, and in one instance three have fallen victims to the malady. The imperfect sanitary condition of the place, it is added, may account in some measure for the malignancy of the disease.

CHURCH-BUILDING NEWS.

Twickenham.—The new portion of Holy Trinity Church, Twickenham-green, was consecrated on Christmas-eve. The church, which stands on the south side of Twickenham-green, originally consisted of a nave, aisles, shallow chancel, recess, and tower at the north-west angle. The new portion consists of north and south transepts, with aisles, measuring from north to south 72 feet, and from east to west 34 feet; beyond which is a chancel, with an apsidal termination, which on plan is a semi-decagon. The old chancel arch has been retained, and now forms the eastern line of division between the old and new portions of the church. In the transepts are nearly 400 additional seats. The apsidal portion of the chancel is paved with Minton's encaustic tiles, the passages in the transepts with plain black and red tiles. The roof and seats are of deal, stained, the latter being varnished. It is intended ultimately to fill the windows with stained glass throughout the new portion of the church. Externally, among the chief features are the three-light windows on the north and south ends of the transepts. The sides of the apse are surmounted by gables, with crockets and finials. The windows in the apse are five in number, and single lights. A new porch on the north side and a vestry at the south-east angle have also been added. Under the vestry is the furnace-room for the hot-water apparatus whereby the new portion of the church is warmed. The style adopted is Middle Pointed, and the material employed is white brick, with Bath-stone dressings, &c., to assimilate with the old building. As the increased length of the church necessitates additional height to the tower, it is intended to surmount it with a lofty spire. The cost of the additions, exclusive of the spire, is about 2,800*l.*; and the alterations have been executed from the designs and under the superintendence of Mr. Francis T. Dollman, architect.

Yarmouth.—Sir: Under the general head "Church-building News," and "*Norwich*," page 901, you give what purports to be some information about St. Nicholas Church. As this must refer to the church of that name at *Great Yarmouth*, allow me to call attention to this error, and to inform you that I am the architect engaged for its restoration. May I request you to mention this fact in some future impression of your journal?—JOHN. P. SEDDON.

Otford (*Kent*).—The ancient church of Otford has been reopened for Divine service, after having undergone a restoration internally. The old wooden pillars have been removed, and a new arcade of four bays substituted, divided by stone columns. At the first pillar an arch is thrown over the nave, which creates a chancel sufficiently large to accommodate the choir. The whole of the roof is new. The chancel is paved with Minton's tiles. The gallery is removed, and the arch opening into the tower thrown open. The seats are all open, and of oak. The warming is accomplished by an air-chamber which passes under the aisles, and at convenient and not unfrequent distances fireplaces are made, and over them an iron plate with very small openings. The arrangement, we were informed, consumes its own smoke. Mr. G. E. Street was the architect employed.

Dorking.—The chancel of the parish church is at last to undergo a thorough restoration, at the sole cost, it is understood, of Mrs. Hope, the Deepdene, as a memorial of her late husband.

Sevenoaks.—A small church has been erected by Mr. Jay, the contractor for the new South-Eastern Railway, for the use of the workmen, this place being the centre for extensive works now in progress. The building, which has been opened for public worship, has been erected within three minutes' walk of a large number of labourers' huts: it is of galvanized iron. The seats are of plain deal, and are calculated to hold about 150.

Tenterden.—At a meeting of the committee for the restoration of the church, there were three tenders sent in, viz.—H. Runnacles, Halsted, 2,231*l.* 14s. 11d.; P. Newnham, Tenterden, 1,850*l.* 4s. 9d.; and J. Bourne, Woodchurch, 1,814*l.* 5s. 4d. Mr. P. Newnham's tender was accepted. The secretary reported that the sum already contributed amounted to 1,543*l.*, and it was resolved that the architect (Mr. E. Christian) be instructed to prepare a form of contract to be entered into with Mr. Newnham, for re-seating, re-paving, re-plastering the walls of the interior, and restoring the arches; taking out the dormer windows in the roof, and restoring the carved oak; repairing and oiling the oak roofs in the side aisles; restoring all the doorways and doors; restoring the stonework of the west window [the stained glass of this window is the gift of Mr. Whelan]; for new windows in the north side of the church; and six new windows in the south side. According to the contract, after doing the above work, a sum of 17*l.* will remain towards the warming and lighting, which with a few other things, such as wire doors, hassocks for the poor (required as a condition of the grant given by the Church Building Society), matting, &c., will require about 200*l.*

Grimley.—The chancel of Grimley Church, which has been for some time under restoration, has now been reopened. The chancel arch and east nave wall have been rebuilt, chiefly by the landowners in the parish. The north wall of the chancel has been also rebuilt, and the whole put in repair; a new open roof of stained fir and gilded iron gable-cross put on; the floor raised and laid with tiles; longitudinal benches, with desks and subsellæ, of varnished deal, substituted for the former seats. The lessons are read from a lectern, of oak, from the ancient roof of the now demolished Guesten-hall, at Worcester. This latter was designed by Mr. Hopkins, of Worcester, architect, and executed by Mr. Finch. The material work of the chancel was done by Mr. Smart, of Malvern, under the direction of Mr. Christian, architect, and at the cost of the Ecclesiastical Commissioners.

Shipston-on-Stour.—A cemetery is about to be formed here. The Burial Board have fixed upon a spot on the London-road, and have agreed for the purchase of two acres. The architect employed in the matter is Mr. W. H. Knight, of Cheltenham, who has furnished designs for the necessary buildings, being two chapels, with spire, entrance lodge, &c. The Burial Board have lately advertised for contracts.

WORKS IN STAINED GLASS.

Armagh Cathedral.—Messrs. Lavers & Barraud have completed a window for Armagh Cathedral, to commemorate the late Primate. It is of considerable dimensions, and contains three lights, with tracery: its cost, together with two small side windows, is 500*l.* The late Archbishop Beresford, it is well known, was a great restorer of churches: he spent a very large sum, we believe nearly 40,000*l.*, on the restoration of the cathedral. These circumstances suggested the design, which illustrates the dedication of the Temple by King Solomon, and its subsequent restoration under Ezra and Nehemiah. These events occupy the chief space in the window. At the bottom, however, is a predella of the three following subjects:—The Mission of St. Columba to Ireland; the Founding of Armagh Cathedral; and its Restoration by the late archbishop, whose portrait appears in this panel: at the bottom is an inscription. The tracery is filled with a large Majesty and beatified Saints. The window promises to be very effective if there be plenty of light outside.

All Saints' Church, East Clevedon.—A stained glass window has recently been placed in this church by Mr. T. Andrews. It has been manufactured by Mons. L'Evegne, of Beauvais, and is a design of foliated tracery. The window has twelve principal lights, intersected with twelve quatrefoils, with a large quatrefoil in the centre. Sir A. H. Elton, bart., has presented it to the church.

St. Catherine's, Angel Meadow, Manchester.—This church has been re-opened after a thorough cleaning and decorating of the interior. All the old windows have been taken out and replaced with cathedral-tinted rolled glass, with rich borders. The chancel window is a triplet, and the centre light contains a full-length figure of St. Catherine; and in a panel above is a descending dove. The side lights are of geometrical design, having medallions of the four Evangelists, Agnus Dei, cup and vine, &c. The wall decoration and stained glass were executed by Messrs. Edmundson & Son, under the superintendence of Messrs. Speakeman & Charlesworth, of Manchester, architects.

Saints Simon and Jude, Manchester.—This church has undergone considerable alteration lately. In addition to the alterations and wall decoration in the chancel, there are three lancet lights now filled with stained glass. In the centre is "The Crucifixion," attended by the beloved disciple, John, and the mother of our Lord, with the Magdalen weeping and embracing the feet of Jesus. In the side lights are half-length figures of St. Simon and St. Jude. The emblems of the Evangelists, &c., are in medallions. A large wheel in the gable is also filled with stained glass of geometrical design. The whole was under the superintendence of Mr. J. M. Taylor, architect, of this city. The stained glass was by Messrs. Edmundson & Son.

Holy Trinity Church, Halifax.—The chancel window of this church, which is large and of Romanesque character, has just been filled with stained and painted glass. The large square-headed opening in the centre is filled with the subject of the Crucifixion: the semi-circular head, which is divided from the light below by a stone transom 20 inches thick, is occupied by a representation of "The Raising of Jairus's Daughter." The square-headed sidelights have full-length figures of Faith and of Charity, in panels of diaper-work. It has been erected by Dr. Alexander, of Halifax, in memory of his late wife and several of the Alexander family. The whole was designed and executed by Messrs. Edmundson & Son, of Manchester.

St. Peter's Church, Newcastle-upon-Tyne.—A stained-glass window, in memory of the late Mr. John Abbot, has been placed in one of the north side windows of this church. The illustrations on the glass appear principally to have been taken from the parable of the Talents. The first group of figures, in the centre compartment of the base of the window, represents Christ in the act of delivering the talents to the three servants. In the compartment to the left side of the centre one are the two faithful servants ploughing and sowing, while the third servant is represented as hiding his talent. In the compartment to the right side of the centre the two faithful servants are shown to be reaping the fruits of their industry; and the third servant in the act of digging up his talent. In the three compartments immediately above the base of the window, the servants are represented to be awaiting the return of their Lord; then, producing before him the increase they had made in properly using their talents; and, lastly, a representation of the two faithful servants kneeling before their Lord, whilst he pronounces the benediction upon them. Above these last-named groups are the usual architectural canopies or quatrefoils. The tracery round the edge of the window is filled with ornamental glass. Messrs. Wailes were the artists

St. Mary's Roman Catholic Cathedral, Newcastle-upon-Tyne.—A memorial of the late Mr. Wm. Dunn, of Bath House, has been put up in this church. It consists of a window of three lights, and tracery above. It is situate in the baptistery, on the right-hand side on entering the church by the west door. The principal subject occupying the centre light is that of our Lord's baptism in the Jordan by St. John; the trefoil in the tracery immediately over it containing the descending dove, surrounded by rays of light. The side compartments of the window contain large figures of the Virgin Mary and St. William of York, respectively, each carrying distinctive emblems. These three subjects are depicted under architectural and floriated canopies, and raised on lofty bases, under which is a kneeling figure of the deceased at Pridieu, and, in the background, an elevation of the church and presbytery attached to it. The tracery is occupied by figures of angels bearing scrolls with texts. The centre panel contains the family arms, and two smaller ones the monogram of the deceased. Along the base of the window, and extending over the three lights, is the memorial inscription. This window was also by Mr. Wailes.

PROVINCIAL NEWS.

Tunbridge Wells. — The first of a series of schemes for hotel accommodation has assumed a decided form, and the Kentish Royal Hotel Company has been formed. A capital of 50,000*l.* in shares of 10*l.* each (a large portion of which is already subscribed for), is to be raised and expended in the reconstruction of the hotel, from plans by Mr. F. H. Fowler, architect of the Strand and Hastings Hotel Companies. One of the features of the scheme is the construction of an arcade of shops facing to Chapel-place and High-street.

Ryde. The town commissioners have unanimously approved of the new plan of Mr. Cutler for increasing the accommodation of the county-court, and for making other improvements required for the public convenience. Mr. T. Hellyer, architect, said the plans possessed the advantages of including a residence for the hall-keeper and improving the telegraph-office. The new rooms would provide the accommodation required for the county-court. The enlargement is to be made on the west side of the hall, so as not to mar the present building more than necessary, although Mr. Cutler said it could be done with greater economy on the east side. The report of the committee asked for powers to advertise for tenders, and to carry out Mr. Cutler's plans; and the report was unanimously adopted.

Wellington (Salop). — A company has been formed, with a capital of 20,000*l.*, to provide new and suitable market accommodation for this town, and an Act will be applied for in the ensuing session to obtain the necessary powers of purchasing property in the town and carrying out the project. It is proposed to erect a covered market on or near the site of the present market-hall, having convenient approaches from Market-square, Walker-street, and Butchers'-lane. It is proposed to establish an additional market on Saturday; and powers will be taken in the Act to enable the company at a future time to provide a Smithfield. The company have appointed Mr. Bidlake, of Wolverhampton, their architect.

Glossop.—At a public meeting of the ratepayers, the guardians have been authorized to apply to the Poor-Law Board for power to make several new streets in and about the town, under the Public Works Act. The estimated cost of the works is 3,300*l.*, two-thirds of which will be paid by Lord E. G. F. Howard, M.P., the lord of the manor. There are already 222 men at work under the Act, most of whom are engaged in draining inclosed lands on his lordship's estate.

THE PATENT CONCRETE STONE.

A COMMITTEE from London, including Mr. C. H. Smith, Mr. Hayward, Mr. Geo. Dines, Mr. O. Hansard, and Mr. Wyatt Papworth, went to Ipswich the other day to test Mr. Ransome's patent concrete stone, and were met by a number of other gentlemen there. One system of testing was by small sections of the stone being clutched by a pair of grapnels, which were suspended—the upper one from the centre of a long iron beam, like the beam of a pair of scales, the under one being connected by stout iron links with a beam on the floor. A heavy weight hung at one end, and at the other were hooks to receive the weights, as the strength of the material required. By this means a strain was put upon the stone till it broke. Several pieces of Ransome's stone, which had been made in the presence of the committee, in London, were put to the test, together with other specimens of stones similarly prepared, the results, according to the statements that have reached us, being as follows:—Five specimens of Coignet's *Bétons Agglomérés*, yielded to the following strains: 656 lb., 544 lb., 1,168 lb., 448 lb., and 384 lb. on the surface of 6 square inches. Mr. F. Ransome's specimens next tested, showed the following results:—1,104 lb., 752 lb., and 1,184 lb. on the 6-inch surface; 1,304 lb. on a 5-inch surface, and two pieces of concrete stone, made on Saturday night last, from road scrapings, combined by the use of silicates, withstood respectively, 1,616 lb. and 1,552 lb. to the 6-inch surface.

Other tests followed by the application of pressure in hydraulic presses, to several 4-inch cubes of Ransome's stone. These withstood pressures varying from 11 to 16 tons; and the only 6-inch cube tried, at last failed under a weight of nearly 70 tons, from faults in the wood packing on which it rested.

The patent is in the hands of a company to which Mr. Thos. Piper acts as honorary secretary.

ARCHITECTURE PROP-ER AND SHAMISTIC.

SIR,—This little essay is for the information and instruction of those who long to see architecture divested of all mystery and exclusiveness,—taken out of the hands of artists, and put into the hands of those whom Mr. Fergusson calls the "plain cooks." This would certainly be "all very fine, Mr. Fergusson," and there is a great deal of meaning in your recommendation to study cookery-books to obtain a proper knowledge of architecture.

Architecture Proper, as its name implies, is founded on a system of props. Properly carried out, or "architected," as the Athenians have it, it forms one of the bulwarks of a nation as it were,—the props and buttresses on which not only the æsthetic welfare, but the personal safety of a people, is founded. Architecture may be looked upon,—in fact, *is* looked upon by the "plain cooks" who dabble in the trade, and make messes both in the department of public taste and the pockets of their unfortunate employers,—as a system (to make use of the legal Latin of a talented author) of mixandum, roast-andum, boilandum, and fryandum. Let it be candidly admitted that this is a very fair and comprehensive view of architecture; a view that is calculated to enlarge the ideas of architectural tradesmen who undertake to teach pupils what but for this information they themselves might never have known. How often, for instance, do we witness the vigorous attempts of the aspiring genius of a Pecksniff trammelled by the notion that architecture may not be brought down to the level of "plain cookery" and £. s. d., and in such cases all that is produced is a pump, or something equally watery. But in spite of this it cannot be denied that architecture is looked upon by many as a system of repetition, reproduction, and redoubled replication; and doubtless much is to be said in favour of this view.

Before architecture became a trade, the prop was not invented. How and when this artistic and solemn feature originated is a curious and absorbing question. How for long ages the only prop in existence had been the clothes-prop; how the ideas of our ancestors for ages did not advance one peg beyond the ordinary clothes-peg; how at length building after building was erected upon the clothes-prop principle; how, although no one was able to point to the architect who first propped up his buildings, yet the propagation of these principles, and the force with which they influenced subsequent times, are questions each one of which demands a wide field of expatiation and affords a matter of absorbing interest to every lover of architecture proper.

The origin of architecture, although in some probability having its seat in the requirements and necessities of human nature, is far removed from those requirements and improvements which have since obtained. The inherent snobbery of human nature, and the development of the sham and the sensational, form sources which were never dreamt of in times of crude simplicity; these elements of comparatively modern growth have been most powerful in their influence on architecture. The discovery by Rumfungus Addlebrain of the shamistic element was an era in architecture. Modern London, with all its crookarious sinuosities of plan and omnivorous variegated monotony of front elevation—*front*—for, poetically speaking,

> "They puts a front up to the street,
> And builds the back part shabby;"—

Modern London affords an example of the shamistic element of perhaps the highest order. Before this principle obtained there existed a gabular and protruding frontal style of building, each upper story projecting beyond the lower, and in narrow lanes and alleys disclosing a small ribbon of sky by day and a strip of stars by night,—that is, on clear nights. Buildings at this time were wooden; and there being then no insurance societies, were often burnt down. In spite of the sanitary arrangements of the period, a most frightful epidemic broke out, which spread death around in hideous form. This was the "Great Plague" of Old London. Fortunately there came a devouring fire, and swept away the loathsomeness, the crowding, and the contagion, and for a time let air and daylight into the dungeon holes. *Fortunately;* but although Old London was burnt down, Modern London was rebuilt. Yes; then came brick and mortar; then came chimney-pot and pantile; then arose the hole-in-the-wall style; then flourished the waterbutt style. Now sprang up

miles of front and back wallage, with numberless square holes; in streets and squares, vast, tremendous, prodigious, and pleasingly monotonous; slices and wedges of which placed here and there in various parts of the country, provided residences for the aristocracy and the amphibiosity.

By-and-by came the discovery of "compo." With this discovery came a redoubtable change in architecture. That "compo" influenced composition is very certain; and, like Mr. Briggs's builder, many an architect found, and many a tyro still finds, that "a little compo is all that is necessary."

Coeval with compo reigned a wide-spread gravitation towards the antique. The beauty and symmetry of the forms in the architectural remains of Greece and Italy struck the eye of the age, and acted like a talisman on the newly-discovered element, compo. Now began the peculiar and distinctive Compo style,—a style which produced architects like tadpoles; a style which proved that "compo made the architect," on the same principle that Beau Brummel taught "starch made the man;" and a style which still, to a large extent, is an ornament to London, as far as its features are not obliterated by time and soot.

The Compo style, in the composition of its component parts, is adaptative and imitatory. For instance, here is a column from the Temple of Jupiter Jampots, at Rome; there a pediment from the baths of Nebo Squash, or a portion of the justly celebrated chapel-of-ease to the Colosseum. Well, what can compo effect in such cases?—rather, what can it *not* effect (and I speak now of "compo" both in its material and moral signification)? Its results are marvellous. That which was conceived by deep and mature reflection, developed by genuine artistic feeling and devotion, and wrought out with love and consummate skill, can be dabbed up in compo (we have an eye to *business* in these days) before a man can say "Jack Robinson!"

HI, JACULIS ILLI DEFENDERE SAXIS.

PROVINCIAL TASTE.

SIR,—Knowing you to be earnest in your endeavour to promote the progress of the arts, especially architecture, and that you from time to time insert in your paper commendatory notices of such new works as merit them, and also point out any works that are carried out in a manner contrary to good taste, I venture to acquaint you with a specimen of architecture recently added to our town, Wirksworth, Derbyshire (which already boasts of a Temperance Hall that for ugliness cannot be surpassed), which I am at a loss to describe. Suffice it to say, the building in question is a private residence, intended, I imagine, to be in the Elizabethan style. It has high-pitched roofs, with ornamental crested ridges, gables coped with stone, and surmounted with wheel crosses, very elaborate of the Decorated period. The walls are rough cast, and relieved by square sash windows. The porch I can liken to nothing I have ever seen before. It is of wood framing, panelled, the upper part sashed, and the top flat. It is zigzag on plan, and conveys the idea that it has been some time or other a photographer's studio, built to accommodate itself to some restricted space, such as one sometimes sees at the back-yard of a lodging-house on the hill sides at third-rate watering-places. Why do not owners, when about to build, employ an architect instead of carrying out their own ideas, or relying on the genius of a country builder, for the result is invariably the production of buildings alike discreditable to a town, and offensive to all those who have the slightest pretension to taste?

CRITIC.

ACOUSTIC POTTERY.

YOUR recently published notes on the singular subject of Acoustic Pottery will be read with interest, and, doubtless, bring to light many instances of its use.

The references made in your number of the 19th ult. to the discoveries of vases in the Churches of St. Peter Mancroft and St. Peter Mountergate, both in Norwich, have a possible significance that is evidently not suspected by your correspondent, Mr. M. Phipson, who furnishes them.

I shall best indicate the point to which I refer by quoting from the "Urn Burial" of Sir Thos. Browne, the famous writer and learned physician of Norwich, the following passage in the epistle dedicatory to Thomas Le Gros, of Crostwick, Esq., the discovery on whose estate of certain Roman burial-urns was the fortunate occasion of the incomparable essay in question:—

"We cannot but wish these urns might have the effect of theatrical vessels and great hippodrome urns in Rome, to resound the acclamations and honours due unto you. But these are sad and sepulchral pitchers, which have no joyful voices; silently expressing old mortality, the ruins of forgotten times, and can only speak with life, how long in this corruptible frame some parts may be uncorrupted; yet able to outlast bones long unborn, and noblest piles amongst us."

The reference to the "hippodrome urns" is to the main point before us, and indicates knowledge of their functions in the mind of the learned writer, who was a parishioner of St. Peter's Mancroft, I believe, and was certainly buried, as a tablet on one of the pillars attests, in the church where, in 1850, the examples of acoustic pottery were discovered.

My idea is, that as these vessels were discovered under the wooden floor of the chancel, and without other covering than it afforded—which suggests that they were coeval with it, and not older—they might have been placed where they were found at the instigation of Sir Thomas Browne himself. The form of the vessels, as engraved by you, seems to confirm the notion that they are of the date in question.

F. G. STEPHENS.

FRENCH GOTHIC IN ENGLAND.

SIR,—The French nation is one in which stateliness, grandeur, and glory are essentially national traits, inherited from the Romans. It has come down to this day, and forms even a leading feature in modern Parisian architecture. In the Middle Ages French architecture bore the same external character. In England, however, stateliness and grandeur were not traits in our Gothic architecture. Like our scenery, it was confined, homely. English poetry, in like manner, was never of a "grand" kind. It is noticeable for its tenderness of thought and homely nature: and so our architecture. If, in the present day, grandeur is necessary, all I can say is that England has lost its traditional beauties of thought, and, I am sure, will never succeed in aforeign line. But, I believe that the unnatural fight for *position* in modern English life creates that unsettled state of mind which can only find pleasure in unnatural excitement. Hence the origin of "sensation" dramas, novels, &c. This state of life is very detrimental to a love of home, of fireside, and not likely to produce much poetry. Our modern poets are precisely those men who are least influenced by such national vices. I maintain and challenge any one to refute it, that the stately grandeur of French Gothic is wholly contrary to English poetry—is wholly contrary to *true* English feeling; and, if we admire it in a Latin race, we cannot admire it at home, since it is destructive of all that is most to be cherished in the sweet homeliness of English country life. It does not agree with our scenery,—nor with our innermost feelings.

QUAM DILECTA.

CHANCELS OR NO CHANCELS.

As Mr. Elliott has openly accused me of dishonesty; and as throughout his letter of the 12th ultimo he endeavours with an ingenuity worthy of the great Mr. Chaffanbrass himself to throw dust in the eyes of the jury by making me appear to contradict myself, and by interlarding his cross-examination with funny stories of *Lord Dundreary* and a great deal of "prave 'orts," as Parson Evans would call them, about "walls of salvation," "apostolical specifications," "lines of judgment," "plummets of righteousness," &c.; I must ask you to allow me space to say a few words in vindication of myself, and to endeavour to put the real question at issue more plainly before your readers.

The whole thing "lies in a nutshell." Mr. Elliott asserts that, in the primitive churches, the altar stood *without* the bema, "*in the midst of the people;*" and that it thus affords no prototype whatever of the "chancel" of Mediæval and modern churches. His theory is that the building and adorning of chancels arose entirely out of the dogma of transubstantiation: well nigh every word of his letter in your number for November 28, and most of that in yours of the 12th ultimo, rest wholly on the supposition that this assertion is true, and go for nothing if he cannot prove it. As his opinion on this question is totally opposed to that of most architects, and, indeed, most Churchmen of the present day, the *onus probandi* lies with him. As yet he has given us bare assertions, and nothing more. Can he *prove* that in any church built previously to the ninth century (putting out of the question those circular ones originally designed as tombs or baptisteries) the altar did not stand, and could not have stood originally *within* the bema? He has challenged all the world to give an instance of a church built at that period in which it *was* placed there. I have quoted a passage which seemed, and still does seem, to me to prove that, in the very earliest church of which we have any description, it *had* that position *within*, and not without, the *cancelli*. Mr. Elliott boldly accuses me of having garbled the quotation, and by substituting "bema" for "temple," made Eusebius say the opposite of what he really does. This is a grave charge, and not lightly to be brought against any one. It so happens that I quoted from Bohn's translation (the only edition at hand at the moment), *without altering a word*. The historian begins his description at the atrium, and goes down the church till he has come to the end; and, in quoting the final passage, beginning "This he adorned with lofty thrones," &c., I simply remarked that Eusebius was clearly speaking of the bema. Mr. Elliott himself confesses that he is speaking of it in the beginning of the sentence; and most persons of ordinary common sense and unbiassed minds would, therefore, suppose that in what follows he is still speaking of it. But, no, argues Mr. Elliott; the altar stood in the midst of the church; and, therefore, the historian must be going back to describe something he had passed by. This is simply begging the whole question. The fact that the altar was "made every way inaccessible to the multitude," which Mr. Elliott confesses, is quite irreconcileable with his theory that it stood "in the midst of the people," who at the Lord's Supper "were reclined or seated round it" as at an ordinary *triclinium*.

In the passage which Mr. Elliott translates "*all over the temple,*" putting it in italics to make it seem the more contradictory to my rendering "all round" the bema, the word "temple" does not occur at all in the original, which I have now before me, though it does occur in the previous sentence, from which he has seen fit to transpose it. Again, when speaking of "the Holy of Holies," as Eusebius calls it, he tacks on his own pet phrase, "in the midst of the people," as though he would have his readers believe, that Eusebius was on his side, in his attempt to show that the "*substitution* of *temple* for *church*," and "*altar* for *tomb*, or *table*," is of comparatively modern date! Farther on he says, I am "not content with being wrong in one instance," &c., for, "*it is not true* that only in the adapted basilicas the orientation principle was avoided;" when he knows very well that I never asserted anything of the kind; but said plainly, "a basilica facing north and south, *or a site which, though otherwise convenient, compelled such an arrangement.*" Again, when he expresses himself as *amused* at my denying that the compilers of our Prayer Book meant to refer to the arrangement of churches of an earlier than Mediæval epoch,—in the rubric; as though this denial implied that there *was* a difference between the primitive and Mediæval arrangement; he must be aware that my words, as I wrote them, do not imply anything of the kind. I leave it, then, to your readers to determine whether Mr. Elliott or myself best deserves the charge of want of "*common honesty.*" And I repeat that it *is* "an insult to common sense," to say that the men who ordered, "*chancels shall remain as they have done in time past,*" meant "they shall *not* remain as they have done for the last 500 years and more," which is the construction Mr. E. would have us put upon their words. That gentleman goes on to ask whether I do not know, or have forgotten, that "the Church of England condemns as idolatrous and blasphemous those doctrines of the Church of Rome which originated the Mediæval chancels?" just as if my whole letter were not an emphatic denial of his assertion, that they originated in the dogma of transubtantiation; and as if I had not plainly shown that while the Church of England renounces that dogma, she does not condemn, but holds and teaches, the doctrine of the Real Presence, which, as I said, "gives all its life and meaning to the whole system of eucharistic worship, and to that archetypal arrangement of the Christian temple

which, by common consent, the church adopted from the earliest times." Mr. Elliott finds it convenient to ignore all that I said touching the arrangement of the oldest Eastern churches, such as the churches of Sergius and Bacchus, at Constantinople (built in the reign of Justinian), those of St. Clement at Ancyra, and Trabula in Lycia (only a little later in date); of St. George at Salonica (built circa A.D. 400), of which Mr. Fergusson remarks that it has "*a well-defined choir with its apse, evidently part of the original arrangement;*" and many others. But as he seems bent on *going to Rome* for his archetype of a Christian temple, let me remind him that in the basilica of St. Peter (A.D. 300) there is a chancel nearly 90 feet in length between the termination of the nave (the chancel arch, in fact) and the bishop's throne at the back of the apse. In the church of Sta. Maria Maggiore there is one of at least half that length, which was built by Pope Sixtus, A.D. 432; while the church of S. Apollinare Nuovo, at Ravenna (A.D. 493–525), presents the very prototype of a modern chancel built out far beyond the termination of the nave and side aisles, and ending in an apse. Will Mr. Elliott undertake to prove that at any given time since the erection of these churches (in each of which the chancel and apse are evidently contemporaneous with the rest), the altar did *not* stand where it has stood from time immemorial *within the chancel*; or that in any one of them at any known period it *did* stand in any other position? I have thought it right to make this reply to Mr. Elliott's most unfair letter; but here the controversy may stop, as far as I am concerned. I am quite content to leave the question at this point in the hands of your readers.

WILLIAM PURTON.

P.S. Perhaps I ought to have referred to the church of San Clemente in preference even to those I have mentioned, built in the fourth or fifth century, and rebuilt in the ninth: it has remained all but unaltered in its arrangements since; and there the altar, with its canopy supported on four pillars, stands far within the railing of the bema, outside of which are the seats for the choir.

ARE THERE ANY DRAWINGS IN EXISTENCE OF THE PALACE OF CANONS, NEAR EDGWARE? IF SO, WHERE ARE THEY?

THOSE who feel interested in the fine arts, especially that department relating to architecture, as practised in this country during the early part of last century, may meet with many passages in the writings of that date alluding directly or indirectly to the magnificence of the expensive palace of Canons, erected some time between 1715 and 1744, by James Bridges, Esq., created a baronet, baron, viscount, earl, marquis, and ultimately duke of Chandos, who by some means acquired a princely fortune, as paymaster of the forces in Queen Anne's reign. He was usually called "the Grand Duke," from the grandeur and almost regal state in which he lived. His grace expended on the building alone about 300,000*l.*: the same quantity of materials and labour would now cost double that sum. The entire edifice was designed and executed under the direction of John James, architect (of Greenwich): it stood at the end of of a spacious avenue of trees, being placed diagonally, so as to show two sides of the building, which at a distance gave the appearance of a palatial structure of great extent. Vertue describes it "as a noble square pile, all of stone, with statues on the front: within was a small square of brick, not handsome; the out-offices, of brick and stone, very convenient, and well disposed; the hall richly adorned with marble statues, busts, &c. The ceiling of the staircase was painted by Sir James Thornhill; the grand apartments finely adorned with paintings, sculptures, and furniture." The columns and pilasters which separated the hall from the grand staircase, were each made of one entire block, rather more than 20 feet in length, of the finest quality of Italian veined marble: all the steps of the principal staircase were of similar material. The locks, hinges, and furniture of the doors were of silver: the internal decorations, of historical painting and sculpture, were of the most costly description: the grounds were adorned with a profusion of statuary, by Charpentiere and other sculptors. The chapel was equally elaborated and embellished with paintings of the Italian school, by Bellucci. The vocal and instrumental portions of the services were arranged and performed by the most eminent musicians of the day. Handel, who resided at Canons, as "chapel-master," is said to have composed his sacred drama of "Esther" for its consecration.

During the very short time that the Palace of Canons remained undisturbed, except by royal or aristocratic entertainments, it was frequently celebrated, both in verse and prose, especially indirectly by Pope; but admitting what there is little doubt of, the poet's intended application of his satire to Canons, his concluding lines are singularly prophetic:—

> "Another age shall see the golden ear
> Imbrown the slope, and nod on the parterre,
> Deep harvests bury all his pride has plann'd,
> And laughing Ceres reassume the land."
>
> *Moral Essays.*

This sumptuous mansion, and nearly all belonging thereto, by a fate as transient as its founder's career, barely survived him: after many fruitless attempts to dispose of it entire, it was pulled down soon after his death, which occurred on the 9th of August, 1744, at the age of seventy-one years, and the materials were sold by auction in the year 1747. The duke was involved at the time of his death, probably in consequence of having lost enormously by the "South Sea bubble" in 1720. The site and most of the building materials, together with the park and demesne lands, were purchased by William Hallet, the cabinetmaker, living in Long-acre, London, who had been extensively employed by the duke. The Corinthian portico was removed to and erected at Wanstead house: the beautiful marble staircase and columns were erected in the Earl of Chesterfield's residence in South Audley-street, London, at present occupied by the Marquis of Abercorn; and all that remains of the celebrated equestrian statue of George I., with its pedestal, has long decorated the area of Leicester-square. The present villa, or dwelling-house, once occupied by Lady Plumer, is said to have been only a distant outhouse, perhaps a residence built by Mr. Hallet, forming no part whatever of the original main edifice.

These are some of the scraps or gleanings about Canons and the grand duke, collected during a long search amongst periodicals, poems, novels, biographies, topographies, &c., all of them written more than a century ago. The general inference seems decidedly to allude to a residence of more than ordinary pretensions; and, judging from the various buildings still remaining in or near London, which were executed from designs by the same architect, who was employed by his grace at Canons, we have a right to conclude that a mansion erected so near the metropolis, apparently without regard to cost, and which was intended to surpass or outshine all others in the kingdom, must have presented many features in the mass, if not in detail, well deserving the attention of architectural students or the criticisms of established practitioners. Every trace of the building itself at Canons seems to have been annihilated, both on the site and in the neighbourhood. I have searched numerous publications and inquired far and wide unsuccessfully: no printed plans, elevations, or views of any kind whatever, can I find or even hear of. During the progress of the building there must have been hosts of working drawings, emanating from the architect's office. Are these all destroyed? Surely some print, drawing, or diagram of that extraordinary edifice must have escaped the general wreck, and it is hoped will be forthcoming, if, through the medium of this journal, these hints respecting the interest attached to such drawings should perchance meet the eye of those who possess them.

C. H. SMITH.

THE LINSEED OIL QUESTION.

SIR,—Last week's *Builder* contains a letter from a "Practical Man" on this subject. Upon reading it I am induced to reiterate my former assertion, that the manufacturers are wholly responsible for the bad oil that is being supplied us. "Practical Man," in his attempt to palliate them and, perhaps, himself, admits that "English crushers are not so particular as they ought *to crush selected seed.*" Thereon lies the whole of the evil complained of; and we surely ought to be much obliged to him for this frank and candid admission; and I can only say that they ought to be particular, and crush only the best selected seed. They have it in their power to do so, and, until they do, they are guilty of *intentional dishonesty and rascality.*

As Sterne says, "they manage those things different in France." At Marseilles there is a standard of quality. All seed brought into the market containing more than 4per cent adulteration is sold at two-thirds less price; thus rendering it the interest of importers to have the seed as clean as possible. And why not crushers adopt the same plan here? It is found to work satisfactorily there, and all cause of complaint against the oil is thereby removed. With regard to "heated seed," if, as "Practical Man" states, it be unfit for crushing, let all that have any regard for their reputation avoid the use of such. But it would seem from this letter that scoundrelism and rascality are rampant and distinguishing features in the operations of English oil-crushers; that they do not hesitate to use any and every kind of seed, both fit and unfit,—not as "Practical Man" would have it, from compulsion, in order to compete with foreigners. If foreign oils are adulterated, I believe it is English competition that has been the cause. Foreigners have the advantage of us in production. Labour, rent, and taxes are less with them than with us; and these are circumstances not to be lightly treated when comparing the producing powers of nations. And I think the assertion is amply refuted of foreigners preferring our oils to their own, when "Practical Man" admits that we adulterate in order to compete; thus showing that there is little or nothing to be gained in point of *quality*, as I apprehend the price to be the same.

With regard to improving, or removing the bad qualities of linseed oil, by any process, I think this to be fallacious also. There can be nothing like to producing a genuine article at first hand, and thus saving additional trouble and expense. I do not see how a thing even renovated is to compete with a thing requiring nothing of that kind. I am not aware that genuine linseed oil contains anything objectionable. It is the bad qualities incorporated by adulteration, from whatever cause, that painters complain of, and that render it impossible to make good work. And I very much doubt whether we shall witness any improvement in this direction as things stand at present. That we shall be liable to further adulteration may be expected; and particularly in turpentine, is to be drawn from your correspondent's letter: thus satisfying me that the superiority of English commercial goods and transactions is a fiction, and that we abuse and stigmatize other nations merely to cover our delinquencies.

Permit me to observe that Continental Governments are more severe upon adulterations of all kinds than we. In France a conviction for certain kinds of adulterations renders the delinquent liable to keep a paper in his window announcing the fact; and the removal of it before the proper time entails heavy penalties. What shall we place against this? Our Government encourages this species of fraud rather than represses it: hence the prevalence of it; and I am sure, if there is one subject demanding immediate attention from the Legislature, it is the adulterations in the oil, colour, and varnish trade; and if not dealt with, they promise to become in time one mass of fraud and corruption. This oil question cannot be too extensively ventilated. The interest and well-being of thousands of honest tradesmen in the painting trade are bound up in it, and who would only be too glad to witness a mitigation of this intolerable evil.

NATHANIEL BESLEY.

THE THEATRES.

The Haymarket. — The new extravaganza, "King Arthur, or the Days and Knights of the Round Table," is written by Mr. W. Brough, and includes some pretty music, very well sung by Miss L. Keeley, and some very well-painted scenery by Mr. O'Connor and others, especially the "Realm of Faëry Pleasaunce," and so forth; but it sadly lacks humour and poetry. We want a higher and more satisfying class of entertainment, to make head against the horrible word-torturings to double-shuffle accompaniments now unhappily prevalent. The Haymarket is the house to which we should look for it. "Lord Dundreary" has returned, and, backed up by Mr. Buckstone as Asa Trenchard, promises to be as popular as ever for some time to come. The piece has been remodelled to a considerable extent, offering sufficient inducement to those who have laughed before to go and laugh again.

The Princess's.—Well done, Mr. F. Lloyd. The transformation scene for the pantomime here, "Harlequin Little Tom Tucker," is one of the most successful achievements of the season, a charming conception admirably carried out. In the first instance, a lake illumined by moonlight is seen, to all appearance covering the stage. The water is real, flows in freely at the back, and ripples gradually towards the front of the stage. Nautilus shells float from side to side, and fairies reclining in them (plural, naughtylasses) throw up jets of water with their shells. Then the moonlight fades, and glow-worms and fairy lamps at the edge of the lake find their sparkle reflected in its surface. Finally, the whole character of the scene changes. The water remains, but groves of tropical verdure spring up on all sides, flowers and silver bells glitter on every branch, and shells, with what seems to be a fringe of diamonds drooping gradually forward, reveal the hiding-places of the fairies. These mount and mount till in the background towers a monument of living figures, reflected like the rest in the lake below. A previous scene is also remarkably well painted. The pantomime is altogether a good one, and Mr. George Vining has commenced the season auspiciously.

Sandringham.—It is stated that the Prince of Wales is erecting a private theatre at Sandringham, where plays are to be acted after Christmas.

The Box-keepers at Drury-lane Theatre.—Sir,—It is time Mr. Falconer were informed of the opinion entertained out of doors of some of his box-keepers. They are little better than harpies. A female servant of mine took two youths to the upper boxes on Monday night, and having paid her money, was refused admittance by the box-

keeper until she gave him sixpence. In her flurry with her purse she also gave him a half-crown, which he refused to refund. To make the case worse, one of the lads was left in the lobby, and this respectable person, to whom the public in that part of the house are entrusted, would not open the door for him without sixpence more. My servant went down to a policeman afterwards, but could get no redress. If the money be sent back to your office, with an apology, within a couple of days, the matter may drop, so far as I am concerned,—though I hope others will take warning and avoid the risk: if it be not, I will try what a summons to Bow-street will do towards exposing the system.

A FATHER.

Books Received.

Another Blow for Life. By GEORGE GODWIN, F.R.S., assisted by Mr. J. BROWN. London: W. H. Allen & Co., Waterloo-place. 1864.

IN simply notifying the publication of this book, we quote the Preface to show its scope:—

"Lately, the people of Great Britain have been so violently excited by death in the workroom, amongst satin and flowers, death in the mother's arms, and death in the dank cellar; by death in Regent-street, death in Clerkenwell, and death in Bethnal Green, all premature and unnecessary, that they can scarcely require many more violent impulses to lead them to take any steps that may be necessary to prevent the repetition of such horrors,—to stop the involuntary suicide and unintentional murder now daily and hourly committed in the very centres of civilization.

Some previous endeavours on the part of the writer, humble but most earnest, to make apparent the frightful condition of parts of the metropolis and other large towns; the way in which life is shortened, health depreciated, happiness prevented, how the manners are degraded, crime and sorrow increased, to show the evils that lie hidden around us on every side, and in the suppression of which all classes are, even selfishly, concerned, met with wide and satisfactory recognition.

These endeavours had the countenance, if the observation may be permitted, of the good and illustrious Prince whom the nation does not cease to deplore; and her Majesty the Queen was pleased 'very graciously to accept,' in special terms, the little volumes setting forth some of the results of many examinations of the houses and resorts of the toiling population, made with a view to that suppression.

The evils pointed out, the dangers deplored, unhappily still remain,—modified to some extent, it may be, by the efforts of a gradually advancing public opinion, the result of increased knowledge; and I am impelled and encouraged once more to place before the public a body of observations bearing on the subject, with a statement of some definite requirements attainable without difficulty by governing powers, and some hints that may, it is hoped, be useful to those moving in a much higher sphere than the miserable dwellers in the fever-tainted dens of Bethnal Green, Whitechapel, and Spitalfields.

Ten years ago I pointed attention to the miserable condition of these districts, and said, 'From dirt comes death.' The warning, however, failed to produce any appreciable effect, or the country might have been spared the ghastly recitals which, day after day, have recently filled the public journals.

All are willing to admit that evil is done by want of head as well as by want of heart; but few, even where the will is good and disposition kindly, stop to inquire how far their own head fails,—to what extent they might themselves aid in changing a state of things they know to be evil, and deplore. It will be a reward if any such be brought to thought and so led to action by the statements in this little book."

Many of the particulars given have appeared in these pages, but the whole is rearranged, verified to the present moment, and for the most part rewritten. The volume has forty-one illustrations, is beautifully printed by Messrs. Cox & Wyman, and bound by Messrs. Bone & Son.

On some Legal and Economic Questions connected with Land-credit and Mortgage Companies. By A. G. HENRIQUES, Esq., Barrister-at-Law. London: E. Wilson. 1863.

LAND-CREDIT and mortgage companies are well known and esteemed in Germany and France, and one has even been established in Canada, of which Mr. Henriques does not seem to be aware; nor that one is about to be established on the Canadian model in this country; but the British public as yet have little or no knowledge of the subject, although such companies bear a somewhat similar relationship to the land with that which respectable building societies bear to house property, only in general on an extensive scale. Thus the Credit Foncier de France, which commenced with a nominal capital of 2,400,000*l.* sterling, has, at the present time, effected loans by way of mortgages with landowners to the extent of no less than 19,000,000*l.* sterling. Its bonds are not locked up in a useless way, but constitute a sort of circulating medium much esteemed and trusted in by all classes and descriptions of investors, and commanding a premium in the money market.

Public joint-stock companies seeking to employ their capital and funds, in making advances, by way of mortgage, on the security of land; or intending to purchase land with the view to subsequent sale; or desiring to promote land cultivation, by aiding improvements, &c., on the land, have been recently established for Australia and New Zealand, for some of the South African colonies, and also for India; and as we have said, a land-credit company is now proposed for England.

All of these companies have for their original model the Credit Foncier de France, the very great success of which has no doubt stimulated and induced the establishment of kindred institutions.

The Credit Foncier de France allege that, by means of their bonds, they have solved the long-vexed question of giving currency to land; that the facility of obtaining, on the security of land, a negotiable instrument bearing interest, and transferable from hand to hand, has given to land the advantages usually believed to be exclusively possessed by moveable and personal property. Money, it is contended, is no longer locked up in investment on land, inasmuch as a mortgage effected by a landowner with a land-credit company, coupled with an issue by the company of land-bonds readily turned into money, ensure that "play" of capital which financiers hold to be essential to its profitable employment. These allegations lead to the consideration of the important economic questions connected with land-bonds and negotiable securities charged on land generally, and especially with the bonds or debentures of land-credit companies. These questions are considered by the author of the pamphlet under notice. The subject is an important one, and well merits the public attention.

VARIORUM.

"The Art-Union of London Almanac, 1864." 444, West Strand, W.C. This is one of the best, and it is the least, of all the almanacs. Its dimensions are 3¼ inches by 2¼ inches, so that it is suitable either for the waistcoat pocket, or the lady's pocket; and many a pocket of both sorts usually contains it. Among the miscellaneous information which it gives, are the meetings of scientific and other societies, and all the red-letter or other notable days throughout the year. ——"Chambers's Journal of Popular Literature, Science, and Art:" Fourth Series: extra new year's double number. William and Robert Chambers, Paternoster-row, and Edinburgh. This "new year's" number is the Scottish equivalent for the English Christmas numbers of periodicals, for Christmas Day is not much held as a holiday in Scotland, New-year's Day, as in France, being the great day there. The number of "Chambers's Journal" under notice is titled, "In the Box." It comprises a series of capital stories, strung together by the members of a jury, by way of convincing an obstreperous unit of the twelve. First the case under consideration is stated; then we have what Mr. Sunnyside, the photographer, thought of it, and his story; which calls up Mr. Drumfich, an intelligent foreign gentleman; but Mr. Crasket is not yet convinced, and Mr. Richards is induced to tell *his* story, which Mr. Watkins caps; and the Messrs. Rooster, they tell their Aunt Sarah's story, which at last satisfies Mr. Crasket, and the twelve are agreed, and all goes merry as marriage bells. Various improvements are contemplated for this new series of the oldest of our cheap journals.

Miscellanea.

THE DRINKING-FOUNTAIN MOVEMENT.—Mr. C. P. Melly has offered to erect twelve additional founts in districts of Liverpool where they are greatly needed. Mr. Melly has submitted his proposition to the water committee.

THE NEW STREET IN SOUTHWARK. — Mr. Thwaites and the Metropolitan Board of Works are to open the new street in Southwark, throughout its whole length, on this (Friday) morning, including the subway now finished.

LECTURE ON THE ADVANTAGES OF A KNOWLEDGE OF SCIENCE AND ART. — At Macclesfield Town-hall, in connexion with the Macclesfield Useful Knowledge Society, Mr. Buckmaster, of the Department of Science and Art, South Kensington Museum, recently delivered a lecture upon this subject, with a statement of the conditions upon which aid is afforded by the Department to classes in connexion with Mechanics' Institutions. The mayor occupied the chair.

LIMESTONE MINERS' STRIKE. — 500 limestone quarrymen have been on strike for several weeks through the district of South Staffordshire and East Worcestershire for an advance in their wages, but have resumed work, the masters having made a full concession to their demands. This is the second advance of 6d. per day which has been made since the present general spur in the trades of the district. Their present wages are 4s. per day. The limestone loaders have also got an advance, and are now in receipt of 5s. 6d. per day.

ARCHITECTURAL SOCIETY OF ARCHDEACONRY OF NORTHAMPTON. — The annual meeting of the members of this society was held at the society's room, Gold-street, Northampton. The chair was occupied by the Rev. Lord Alwyne Compton. The meeting having been opened, the secretary, the Rev. N. F. Lightfoot, read the annual report, which was unanimously adopted. The statement of accounts was read by the Rev. D. Morton, and showed that last year there was a balance in hand of 29*l.* 14s. 6d. There had been received 137*l.* 10s., making a total of 167*l.* 4s. 6d. The expenditure had been 135*l.* 13s. 8d., leaving a balance of 31*l.* 10s. 10d. The Rev. N. F. Lightfoot was appointed secretary, in the place of the late Rev. T. James.

TELEGRAPHIC.—An offer has been made to connect the whole of the West India Islands by telegraph with the mainland at Cayenne, in French Guiana, and at Key West, near Florida, if a guarantee of 6 per cent. on the outlay can be obtained. The cost is estimated at 300,000*l.* ——Some interesting experiments with printing inks have just been taking place at the printing-office of Miss Faithfull, printer to her Majesty, the object being to test the utility of ordinary printing by telegraph. An Italian gentleman has invented a process of printing by telegraph, which is said to take less than half the present time of transmitting a message. The Lord's Prayer, composed and printed at Miss Faithfull's office, and forwarded to Liverpool, is stated to have taken two and a half minutes only.

LIABILITY FOR NEGLIGENCE. — The case of Byrne *v.* Boadle, in the Court of Exchequer, involved a question of negligence. The defendant had used and occupied the entire warehouse and premises from which a barrel of flour was being lowered. The plaintiff was passing along a public road by the warehouse, when the barrel fell from the warehouse upon and injured the plaintiff. The Court held that this was *primâ facie* evidence of negligence by the defendant, or those for whose acts he was responsible. The plaintiff was not to be obliged to go about and inquire the cause of such an accident—who were in the warehouse above him, and their business there; how it was done, and such like: it was similar to that of a man who had to go through a public passage where a building was being erected, and an injury was caused to him by some of the materials falling on him whilst passing. This would be *primâ facie* evidence of negligence against the builder. It having been shown in this case that the defendant had the entire possession and exclusive use of this warehouse, it would be presumed that the accident arose from his want of care, unless he gave some explanation of the cause by which it was produced.

DISCOVERY IN CULLEN CHURCH, BANFFSHIRE.—During the repair of this church lately, it was found necessary to unroof the eastern aisle; and light being thrown in at the back of the Chancellor's monument, a piece of carving was discovered built into the wall, and which proved to be a cell or repository for the Sacramental elements, built of Covesea freestone, and about 6 feet 10 inches high, by 3 feet in width. In the lower division is a cubical cell, 16 inches by 14 inches. Around it are marks, or holes for "bats" for hinges. Around the outer edge of the cell is a neatly carved moulding, with a vine border, terminating in an arch. Above is the representation of two angels supporting an *Expositorium*, or monstrance, surmounted with a tablet, on which is carved, in bas-relief letters, a Latin inscription, which may be translated, "My flesh is meat indeed, and my blood is drink indeed. He that eateth my flesh and drinketh my blood shall live for ever." The whole is inclosed within a Gothic moulding. On the cornice over the frieze are the marks of two holes; and, as there are two holes below at a corresponding distance from each other, it is presumed they had been used for fixing a veil to cover the carving. The *Banffshire Journal* gives a lithograph of the repository.

THE GLOUCESTER PUBLIC PARK.—The committee of the Gloucester Temperance Society having offered to erect a drinking-fountain in the park, on condition that the Board of Health provide a supply of water and keep the fountain in repair, the offer has been accepted. The fountain is composed of cast-iron. The design is rather Alhambresque than Gothic. The cost will be about 40*l*. The site will probably be at the end of the broad walk towards California.

THE CASTLE HALL, TAUNTON.—The hall of the old Taunton Castle, which has been unoccupied and useless for a considerable period, is a place of much interest. Mr. R. Mattock, the lord of the manor, has just had some alteration effected in the building with a view to its being in future used as a room for public purposes, concerts, balls, public meetings, &c. These alterations have been intrusted to Mr. E. Jeboult, who, according to the local *Courier*, has prepared an historical sketch of the building. The lighting of the room has been intrusted to Mr. Trudell.

NEW GREAT SEAL PATENT OFFICE AND LIBRARY. The Commissioners of Patents having so long neglected to provide accommodation either for their own officers or the public, although it is stated that they have over 250,000*l*. of surplus fees in hand, and that this amount is rapidly increasing each year, an influential joint-stock company, with limited liability, has been projected, for providing the requisite buildings. Mr. Thomas Webster, F.R.S., the patent-law barrister, is amongst the principal promoters. The necessary Parliamentary notices for enabling the site to be acquired have been given. The Inventors' Institute have resolved that it is desirable that steps should be taken for providing a patent-office, conference and arbitration rooms, reading-rooms, library, and all requisite appurtenances, and that a joint-stock company, with limited liability, is the best means of carrying out the object.

THE MIDDLE LEVEL.—The leakage which appeared a short time since in the great dam, constructed so laboriously in the summer of 1862, across the Middle Level outfall drain, has been made good, at any rate for the present. Some doubts are entertained as to whether the syphons erected to discharge the waters accumulating in the drain could really be relied on to meet any extraordinary exigency, such as the sudden melting of a great quantity of snow, or a protracted period of rainy weather; and it is stated that the necessity of erecting a new sluice may possibly come on for discussion. The cost of erecting such a work would be about 30,000*l*. With reference to the case of Cave *v.* Wise, an action brought on behalf of the sufferers by the flood of 1862, to test the liability of the Commission to make compensation for injuries then sustained through the alleged negligence of its officials, should the liability of the Commission to make compensation be finally affirmed, it will have to pay a sum of from 70,000*l*. to 80,000*l*. to the sufferers from the flood.

THE GOVERNMENT BUILDINGS AT DUNEDIN, OTAGO, NEW ZEALAND.—A report by Mr. Millar, the city engineer of Dunedin, on a site for these buildings, together with a map of the site and plans of the buildings, have been forwarded to us from New Zealand. In the report the engineer says:—"The site which I have the honour to propose and recommend as in my opinion the best which the city affords, is that portion of Bell-hill (as shown in provincial engineer's reclamation map as a level plateau, standing at an elevation of 45 feet above the water of the harbour, and containing five acres) at present appropriated to the erection of Dr. Burns's church. This site is the most commanding one which the business centre of the city presents, and is worthy of an edifice upon which the best architectural talent of the Southern Hemisphere may desire to be employed. The site may compete in every respect most favourably with those adopted either in Melbourne, Sydney, Adelaide, or Hobart Town. Indeed, it would be difficult to conceive a finer architectural effect than can be produced by a highly-educated æsthetical mind upon this site, the terraced 'acropolis' of the city,—the Calton-hill of Dunedin." Lest it might not be available, however, he proceeds to describe the next best site, namely a portion of Bell-hill. "The merits of this site," according to the report, "are similar to those of the last, but in a somewhat modified degree. It has the advantage of close contiguity to the business centres of the city, including the courts of law, &c., and yet is far enough removed out of the noisy thoroughfares to insure comparative quietude."

STREET RAILWAYS.—The management of the city railroads in Philadelphia are about to introduce steam upon their various street lines. The value of human life must surely be at a discount amongst the staid old-fashioned people of the "Quaker City."

SALE AT STUDLEY CASTLE.—The Castle of Studley and estate, in Warwickshire, comprising the castellated mansion and nearly 2,700 acres of land, manorial rights and privileges, and the advowson of the rectory of Moreton Baggott, in the county of Warwick, have been sold at Garraway's, for the sum of 145,000*l*., Mr. Walker, of Birmingham, being the purchaser.

ST. GEORGE'S (HANOVER-SQUARE) IMPROVEMENT.—A numerously-attended meeting of the principal inhabitants and others of property in New Bond-street and Oxford-street, likely to be affected by the projected arcade, was held at the company's offices, on the 22nd ult., at which the architect and others gave explanations of the objects and intentions of the company. It was the unanimous feeling of the meeting that the contemplated improvement was a most desirable one; and that in the event of preliminary contracts being made with the several owners of the property required, before the second reading of the Bill intended to be applied for in Parliament, the company need not apprehend any opposition on their part, but that they would give it all the assistance in their power.

ACCIDENTS TO PROPERTY AND PERSON.—The roof and a great part of the side walls of the new Primitive Methodist chapel, Smith-street, Rochdale, has fallen in. The damage done is about 150*l*.——At the Albert Memorial College, in course of erection at Framlingham, three men were engaged in placing a large flagstone, weighing about a ton, in the upper corridor of the building. The stone had been hoisted to the scaffold, and while moving it on a trolley across the passage, one of the bearers broke in two, and tipped over the stone, which carried with it three of the six men engaged at the work to the first-floor corridor, smashing through that, and falling to the ground-floor, a distance in all of about 25 feet. The men were severely injured, and one has since died. The coroner's jury have returned a verdict of Accidental Death, adding, that no blame seemed attachable to any one.

THE WORKMEN'S CLUB MOVEMENT.—Premises have been hired at Margate for a workmen's club-house. At Tipton, in Staffordshire, a meeting has been held for the formation of a club and institute for that district. Sir Horace Paul, bart., was in the chair. Various donations of 5*l*., 10*l*., 50*l*., and 100*l*. were presented. At Hull, a crowded meeting of working men has been held for the like purpose. The mayor, a large employer of labour, presided. Subscriptions, amounting to 60*l*., were announced. The project for establishing a club and institute in York is about to be realized: premises have already been taken. The success of the Birmingham club, in Newhall-street, has given rise to a similar project for Birmingham-heath and Smethwick, where it is proposed to erect a club-house by help of a limited company, with a capital of 500*l*., in 1*l*. shares, with calls easy for working men to pay; all the managers and shareholders to be working men.

THE GREAT SHIP. The misfortunes of this hitherto unlucky ship seem never to end, and the last and not the least calamity appears to have just befallen her. The officers of the sheriff are on board, and the costs of the lawyers are to be added to the already enormous losses. The last passage in the history of this vessel states, that Mr. Justice Mellor ordered that the stores should be sold on shore, and the furniture and other articles which could not be removed without damage to the ship to be sold on board, and the public to have access to the ship. It thus seems that the monster vessel is to be dismantled, a circumstance which most persons will regret; but more is likely to come; and it is not improbable that if arrangements are not speedily made, the sale of the hull will be the next event. Should this become necessary, it is hoped that the vessel will not be sold to foreigners; for a ship which can with extraordinary rapidity convey 6,000 persons at once to any seashore in Europe or America, and which might be employed in the conveyance of immense quantities of stores, should be added to the strength of the British navy; for into the possession of whatever country this vessel may come, it will with good management become a power of the State.

ELY SURVEYORSHIP.—From the three candidates who attended the Board on being written to, Mr. S. Mather, of Epsom, was elected.

THE GREAT FIRE IN THE CITY.—In the newspaper accounts of this fire it was mentioned that but for a revolving iron shutter, protecting a large window belonging to Messrs. Morley, at the corner of Gresham and Wood streets, the ravages of the fire must have extended to Messrs. Morley's premises as well. We are asked to state, and we think it but fair to do so, that the iron revolving-shutter which arrested the fire was manufactured in 1849 by Messrs. Bunnett & Co., of London and Glasgow, the patentees.

MONUMENTAL.—A Leeds memorial of the late Sir Peter Fairbairn, knt., has been started at a public meeting convened by the mayor, at the request of 1,136 memorialists, who propose to erect a statue of their late mayor in Leeds.——A movement in the East Riding of Yorkshire, for the erection of a monument to the late Sir Tatton Sykes, of Sledmere, is making progress.——A tablet to the memory of the late Messrs. Pearce, and W. H. Baldwin, of Stourport, has been erected on the Wesleyan chapel there, at the cost of various workmen employed by the deceased brothers. The monument is executed in Caen stone, and is of the Geometric period of Gothic architecture. The total height of the monument is about 9 feet. It was designed and executed by Mr. P. Horsman, of Wolverhampton, sculptor.

MAPS OF THE METROPOLIS SHOWING PROPOSED RAILWAYS.—Mr. James Wyld and Mr. E. Stanford have each published a map of the metropolis, showing upon it the proposed railways, new roads, and other improvements, as they did last session. It is but right to state that Stanford's is the most complete, giving also the names of the engineers and architects engaged, length, &c., and probably costs a little more. It is scarcely too much to say, that every inhabitant of London and its suburbs should look at one of these maps, and consider in what way his individual interest and the general interest will be affected by the schemes now awaiting Parliament. The House of Commons will, it is to be hoped, order a report upon the *whole*, by competent men, before proceeding to deal with the various projects singly.

PROPOSAL TO BUILD SCHOOLS IN ST. LUKE'S CHURCHYARD.—A deputation has waited upon the rector of St. Luke's, to press upon his consideration the desirability of steps being taken to obtain a new site in the churchyard for the schools now standing in Golden-lane, the building for which has been declared by the medical officer to be totally unfit for the purpose to which it is put. The rector said that neither he nor the bishop could grant churchyard ground for the purpose, although the bishop could grant a faculty for removing bones. He would not urge the present site again, although they must remember that, "bad as the air of Golden-lane was, the children slept in it, and it was their native air." The deputation said all they wanted was the rector's signature to a memorial to the bishop; but the rector said he must consider what was the law on the subject.

CARPENTERS IN PARIS.—A writer in the *Morning Post*, who is examining French workshops, says:—The manner in which Paris carpenters are paid is very trying and very disadvantageous to them. It is the custom of their employers to pay once a month—that is to say, on the first Saturday after the expiration of a month. Some masters reserve to themselves the right of holding a drawback from the workman's salary. In the great workshops a certain sum of the workman's wages is always kept back. When the month finishes on a Monday, the days intervening between it and the following Saturday are reserved for the settlement of the following month, and on this plan wages are reserved from month to month until the end of the year. In short, the working carpenter is compelled to give credit for his labour, even when this is underpaid: on the other hand, he is forced to pay his rent in advance. The payment of a London carpenter's day's work is two-fifths more than that of a Paris carpenter. The Paris workman's board and lodging are at least as dear as these necessities are in London. The Paris workman is, moreover, compelled to provide himself with a large quantity of expensive tools. The Paris workman looks at his London brethren with envy. The *charpentiers* cry aloud that their work is diminishing, and that their numbers are still increasing. In building operations iron is everywhere replacing wood.

GLASGOW INSTITUTE OF THE FINE ARTS.—The 100 guineas offered in three premiums for the best pictures exhibited were awarded as follows:—50 guineas for the best figure picture in oil, to J. Noel Paton, R.S.A.; 30 guineas for the best landscape in oil, to Samuel Bough, A.R.S.A.; 20 guineas for the best water-colour, irrespective of subject, to Henry Tidey, London. The competition was confined to British artists and to pictures painted within the last two years.

MANUFACTURE OF ZINC.—In connexion with the manufacture of zinc, two inventions have recently been provisionally specified—the one by Mr. Adrien Muller, of Paris; the other by Mr. Samuel Healey, of Hackney-road. According to the first of these inventions, it is proposed that the fuel employed shall be raised to a high temperature in special furnaces before being supplied to the blast furnaces, which are to be closed at the top, and provided with a suitable cover or plug. The invention of Mr. Healey consists in constructing the furnaces employed in the melting and annealing of zinc in close proximity to each other, so that the process of annealing may be effected by means of the waste heat escaping from the melting-furnace.

A TRAMWAY FOR MONT CENIS.—A proposal was some time ago submitted by Mr. Fell, in concert with Messrs. Brassey and Jackson, to the French and Italian Governments, for laying down a tramway on the present Mont Cenis route, covering the same with wooden, iron, and stone galleries, and working it by means of a new and lighter species of locomotive. The first series of experiments for producing a low engine capable of carrying a train of 100 passengers, with their luggage, over the mountain, have, according to the *Morning Post*, had satisfactory results. These Mont Cenis locomotive experiments have been carried on at the Cromford and High Peak Railway, Whalley-bridge. It is hoped thus to solve the problem of a rapid and comparatively cheap communication, not only across the great passes of the Alps, but likewise over those of the Apennines.

LEAMINGTON.—The new Roman Catholic chapel here will be completed in a few months. It is situate in Dormer-place, opposite to the Royal Pump-room Gardens. The total estimated cost of the building, including the erection of a presbytery, is 7,000*l*. Under the direction of the contractor, Mr. W. Gascoyne, a large number of workmen have been actively engaged upon the work for several months, but the building operations are now fast approaching completion, and in the early part of next summer, it is in contemplation that the opening services will be held. The designs of the building were prepared by Mr. Clutton, of London, architect,—the style of architecture partaking somewhat of the Gothic and Byzantine orders. Externally, the chapel presents little ornamentation, the materials being red brick, with Bath-stone used in the window and door-work. Internally, the division of the building is threefold; consisting of the nave, which, from the altar to the entrance-door, is 120 feet, and two porticos or aisles, one on either side, each about 100 feet in length. The roof rises over the nave to a height of 70 feet, is circular in form, and has been painted by Monsieur Tony Dury, of Warwick, to represent a coffered ceiling. The two roofs over the aisles have also been treated in a similar manner.

HOTEL AT SUTTON COLDFIELD.—A new hotel is about to be built at Sutton Coldfield. Mr. Edward Holmes is the architect. The building, for the erection of which, at a cost of 6,500*l*., a tender has been accepted from Mr. Charles Jones, is expected to be completed in April next. The elevation is an adaptation of Early English to the domestic purposes of the present century. The building is of red brick, with Bath and Forest of Dean stone dressings, with blue brick, in various designs, interspersed over the large masses of red brickwork. The main body of the building is three stories in height, the wings being carried up four stories, and the central portion over the principal entrance forms a tower, terminating in an observatory, with casements, to open on to a work-stone platform, which is supported on wrought-iron brackets, the roof of the tower being covered with lead, surmounted by an iron pronal. The other roofs will be covered with alternate bands of green and blue slates, and crowned with ornamental iron ridge cresting. The hotel will be situate on the high ground immediately above the railway terminus, and will command views of the scenery of the neighbourhood.

SOUTH KENSINGTON MUSEUM.—The number of visitors during the week ending 26th December, was 12,682.

BRANDY, GIN, AND WHISKY FROM COAL GAS.—Coal appears to be the modern Proteus. A Scottish paper, after stating that brandy has been produced from coal gas in France, under a patent both for France and Britain, says, "the work of manufacture is on the point of being started in London. The richer any coal is in olefiant gas the better fitted is it for the manufacture of spirits (brandy or whisky). The old joke that represented a man who was half-seas over as being 'gassed,' will not be found far from the truth after all."

AUCTIONEERS' COMMISSION.—A mortgagee cannot, when he advances his money, stipulate for an advantage not naturally arising out of his mortgage. Therefore, where auctioneers, at the time of advancing their money upon mortgage, stipulated for an authority to conduct the sale of the estate, and for a commission of five pounds per centum upon the amount of the purchase-money, over and above the re-payment of the principal and interest, it was held by the Master of the Rolls that the charge for commission was not covered by the security. This was the case of Broad *v.* Selfe, in which his Honour said he was not competent for a person under colour of a mortgage to stipulate for a distinct collateral advantage.

INAUGURATION OF THE WHITWORTH INSTITUTE, FLEETWOOD.—The largest meeting ever held in Fleetwood recently took place, on the occasion of the inauguration of an institute built by a Mr. Whitworth, and intended to be devoted to the elevation of the social and moral condition of the working people of the town, by the provision of such comforts and attractions within its walls as will in some measure counteract the corrupting influences of the ale-bench and the taproom. The building stands in Dock-street. Its character is Gothic. Passing through the entrance, on the immediate right and left are the library and coffee-room, each apartment being 21 feet 6 inches by 16 feet 6 inches, and 13 feet high, the latter having independent connexion with the curator's or librarian's residence at the back, which is fitted up also conveniently for any social gatherings. Above the library and reading-room, the lecture-hall is gained by a stone staircase, 5 feet 6 inches in width, the size of this room being 37 feet 9 inches by 42 feet 6 inches, and 37 feet 3 inches high to the top of the ceiling, where the opened timbered roof ceases. This hall has its retiring-room, &c., and a gallery, the latter being reached by the stone staircase above mentioned. The total cost of the whole is estimated at about 3,000*l*. Messrs. Speakeman & Charlesworth, of Manchester, were the architects; and Mr. Drummond, of Fleetwood, the contractor.

RHYL (FLINTSHIRE).—The new Roman Catholic Church of St. Mary, at Rhyl, has been opened. It is in the Norman style, of brick, in red and black bands up to the sides of the windows, and reticulated above, with stone dressings. The windows are narrow and tall, the last two nearest the altar on each side in triplets. There is a wheel window in the west gable. The high wood roof, as well as the whole of the walls, have been painted by Mr. Pollen, with scroll-work, animals, and flowers, in a grave key of colour, black, grey, and yellow predominating. The altar is of white alabaster, chased and carved, the execution having been intrusted to Mr. Hall, of the Derby Marble-works. The reredos is of carved stone and marble, and is also painted. The west window is filled with stained glass, by Messrs. Powell, of London, from the architect's design. The proportions of the building are as follows:—Length, 85 feet; breadth, 30 feet; height of roof, 43 feet. The carvings of the church have been executed by Mr. Williams, of Talacre, and the statues are from the designs of Mr. Pollen, by Mr. O'Shea, carver, from the new Oxford Museum. The total cost of the work, exclusive of fittings and organ, is 200*l*. The whole work has been carried out by Mr. R. Jones, builder, of Rhyl.

TENDERS.

For residence in Bridge-road, Battersea, for Mr. W. Sugden. Mr. J. W. Quilter, architect:—

Deacon	£692	0	0
Simpson	680	0	0
Wardle & Baker	670	0	0
Godbolt	641	0	0
Lathey, Brothers	620	0	0

For the erection of warehouse, for Mr. Robert Morgan, Cock-lane, Snow hill. Mr. A. E. Taylor, architect. Quantities supplied by Mr. J. Clover:—

Higgs	£1,698	0	0
Kilby	1,625	0	0
Brown & Robinson	1,425	0	0
Henshaw	1,432	0	0
Macers (accepted)	1,393	0	0

For restoring the parish church of Trefeglwys, in the county of Montgomery. Messrs. Poundley & D. Walker, architects:—

Jones	£1,320	0	0
Hamer, jun.	1,178	0	0
Woolley	1,050	0	0
Porteous	950	0	0
Evans & Son	790	0	0

For the erection of warehouse for Mr. George Bowles, in West Smithfield. Mr. A. E. Taylor, architect. Quantities supplied by Mr. J. Clover:—

Macers	£2,095	0	0
Higgs	2,067	0	0
Ashby & Son	2,034	0	0
Henshaw	1,932	0	0
Kilby (accepted)	1,900	0	0

For alterations and additions to premises, No. 11, Abchurch-lane, City, for Messrs. Blades, East, & Blades. Mr. T. Pearson, architect. Quantities supplied:—

	Gross amount.	Allowed for old materials.	Net amount.
Wells	£2,746 ...	£55 ...	£2,691
Carter	2,297 ...	40 ...	2,257
Axford	2,180 ...	50 ...	2,130
Hill	2,100 ...	80 ...	2,020
Sharpington & Cole	2,047 ...	70 ...	1,977
J. C. Ramsey (accepted)	1,984 ...	56 ...	1,928

For villa residence, Wimbledon Park. Mr. John Giles, architect. Quantities supplied by Mr. James Barnett:—

Piper & Wheeler	£5,417	0	0
Stap	5,370	0	0
Patman & Fotheringham	5,283	0	0
Peskett	5,234	0	0
Roberts & Strange	5,165	0	0
Bowley, Brothers	5,100	0	0
Baldwin & Dalton	5,012	0	0
Rudkin	4,328	0	0
Aviss & Son (accepted)	4,393	0	0

The contract for the erection of two residences at Erith, for Mr. H. Swaine, has been taken by Mr. J. Drake.

TO CORRESPONDENTS.

A proof shall be forwarded).—H. H. R. (declined with thanks.—W. L. N. (is in type).—A Subscriber (write to the inventor).—J. S.—M.—Messrs. A., R. B., & F.

TO SUBSCRIBERS.

The INDEX to volume of last year will be given in our next Number.

The TWENTY-FIRST VOLUME of "THE BUILDER" (bound), for the year 1863, *will shortly be published, price One Guinea.*

CLOTH CASES for binding the Numbers are NOW READY, price Two Shillings and Ninepence.

A COLOURED TITLE-PAGE can be had, Gratis.

SUBSCRIBERS' VOLUMES will be bound on being sent to the Office, at a cost of Four Shillings each.

This day is published, with Forty-one Illustrations, in cloth boards, 5*s*.

ANOTHER BLOW FOR LIFE: an Exposition of the Condition of the People amidst Existing Frightful Evils, and Suggestions for their Safety.

By GEORGE GODWIN, F.R.S.

London: Wm. H. ALLEN, 13, Waterloo place, S.W.

[ADVERTISEMENTS.]

EXHIBITION CLOCK.—"The entire finish is of the highest caste."—*Daily News*, May 29, 1862. Clocks designed by the first artists of the day for the drawing-room, dining-room, bedroom, library, hall, staircase, bracket, carriage, church, turret, railways, warehouse, counting-house, musical, and astronomical. Church and turret clocks specially estimated for. Benson's illustrated pamphlet on Clocks (free by post for two stamps) with descriptions and prices, enables those who live in any part of the world to select a clock. Also a short pamphlet on Cathedral and public clocks, free for one stamp. Prize Medal and Honourable Mention in Classes 33 and 15.—J. W. Benson, 33 and 34, Ludgate Hill, London. Established 1749. Watch and Clock Maker by Special Warrant of Appointment to H.R.H. The Prince of Wales.

LETTS'S SCRIBBLING DIARIES with half a week, or an entire week on each page, either Folio, Quarto, or Octavo, and interleaved with blotting paper if required, may be obtained of any Bookseller in the Kingdom, and descriptive catalogues gratis. Various other Diaries at 6d., 9d., and 1s. each, with Tablet Diaries, Large Print Almanacks, &c. — Letts, 8, Royal Exchange.

PEDESTAL HOT AIR STOVES.—A number of Pedestal Stoves, suitable for school-rooms, warehouses, churches, &c., manufactured by the late Mr. Pierce, to be sold at a low price. One Stove is of very large dimensions, and is entirely covered with majolica tiles. The Stoves will be sold separately, in perfect condition. They have all been removed from a public building where extensive alterations have taken place.—Apply to MESSRS. EDWARDS & SON, 49, Great Marlborough-street, Regent-street; or at their Factory, 86½, Oxford-street.

ADVERTISEMENTS.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS *left at the Office in reply to advertisements, and strongly recommends that* COPIES ONLY *should be sent.*

No. I. January 1864, price 5s.

THE QUARTERLY JOURNAL of SCIENCE.
Edited by JAS. SAMUELSON and WM. CROOKES, F.R.S.

CONTENTS

Introduction: Scientific Survey.
ORIGINAL ARTICLES.
I The Coal Resources of Great Britain. Edward Hull, B.A., F.G.S. Geological Survey. With Map and Woodcuts
II The Atlantic Deep-Sea Bed and its Denizens. Dr. G. C. Wallich, F.L.S. With Lithographic Plate.
III The Atlantic Cable and its Teaching. Wm. Crookes, F.R.S.
IV The late Earthquake, and Earthquakes generally. Robert Mallet, C.E., F.R.S.
V. Lighthouse Illumination by Magneto-Electricity. Dr. J. H. Gladstone, F.R.S.
VI. The Conservation of Force applied to Physiology. In Two Parts. Part I. The Relation of Light and Heat to the Vital Forces of Plants. Dr. W. B. Carpenter, F.R.S.

London: LONGMAN & CO. 39, Paternoster-row, E.C.

Just published, for 1864, price 4s. the Fifty-fourth Edition of SKYRING'S BUILDERS' PRICES, calculated from the prime cost of materials and labour, containing the whole of the Metropolitan Building Act, list of District Surveyors, and a variety of new and useful information.
Sold by SIMPKIN & CO. Stationers'-court, London; and may be had of all Booksellers.

TO ARCHITECTS, SURVEYORS, BUILDERS, AND OTHERS.
AN ARCHITECT and SURVEYOR, with available assistance, prepares designs, details, perspectives, specifications, valuations of houses, dilapidations, &c. on moderate terms.—Address, ARCHITECT, Office of "The Builder."

A MEMBER of the INSTITUTE, who has been for several years in good practice in ecclesiastical and general architecture, and is possessed of capital, wishes to enter into PARTNERSHIP with, or to take the Business of, a London architect of good position, who is desirous of retiring from the more active duties of the profession. Communications (which will be considered strictly confidential), stating real name and full particulars, to be addressed to ARCHITECT, care of Mr. Lock, Newsagent, 122, Gray's Inn-road, London, W.C.

PARTNERSHIP.—A SMALL SHARE in an ENGINEER'S BUSINESS TO BE DISPOSED OF, suitable to an architect or practical draughtsman. Capital required, 1,500l. to 3,000l.—Apply personally to EDWARDS JAMES, 13, King-street, Cheapside.

GAS and GENERAL ENGINEERING OFFICES, 1, HANOVER STREET, EDINBURGH (opposite the Royal Institution of Arts). Mr. JOHN ROMANS, Practical and Civil Engineer, may be consulted at the above address on all matters pertaining to gas works, water-works, and other engineering questions.—Plans and specifications furnished, works erected and repaired, or taken on lease for a term of years.—Orders received for Scottish Cannel Coal and Fire clay goods.

AGENTS REQUIRED.—The ROYAL INSURANCE COMPANY is prepared to entertain APPLICATIONS for AGENCY APPOINTMENTS from gentlemen having command of FIRE and LIFE BUSINESS.
The ROYAL has always been conspicuous for its liberality and promptitude in the settlement of claims.
Its Annual Income is now over ..... £500,000.
And its Funds in hand exceed ..... £1,000,000.
Transfers of Policies from other Companies received without charge for Policy, whatever the amount.
Address, JOHN B. JOHNSTON, Secretary.
Royal Insurance Company, 29, Lombard-street.

ACCRINGTON, LANCASHIRE.—SURVEYOR WANTED.—The Local Board of Health for the district of Accrington is prepared to receive APPLICATIONS for the SITUATION of an experienced SURVEYOR. He will be required to devote the whole of his time to the duties of the Office, and to reside within the district. Salary, 150 per annum.—Application, with testimonials, to be sent immediately, addressed to "The Chairman of the Local Board of Health, Accrington."
28th Dec 1863. HENRY BANNISTER, Law Clerk.

TO JOINERS' FOREMEN.
MESSRS. GILLOW & CO. are in WANT of a CLEVER FOREMAN; one who is used to steam machinery pre'erred.—Apply at their entrance, Duke-street, Manchester-square.

PUPIL WANTED, in an Architect's Office in London, where a large town and country practice is carried on. Premium, 150 guineas.—For address, apply to J. D. BROWN, Esq. Surveyor, &c., Great George-street, Westminster.

WANTED, a first-class GOTHIC DRAUGHTSMAN.—J. M. TAYLOR, 2, St. Anne's Churchyard, Manchester

WANTED, immediately, a Sober, Steady, WORKING SHOP FOREMAN, in a large Medical Fixture and Glass Case Manufactory. He must be a good draughtsman, capable of measuring quantities and preparing estimates, also quick at setting out work.—Apply, by letter, stating age and references, to W. S. 34, Fetter-lane, E.C.

TO MACHINISTS, &c.
WANTED, a MAN accustomed to WORK one of FURNESS'S TENONING MACHINES, and fill up his time at the Moulding Machine.—Apply at 28, Union-street, South-wark.

WANTED, an ASSISTANT, who has had considerable experience, and is thoroughly qualified in taking out quantities. Also TWO JUNIOR ASSISTANTS, who are fully competent to carry draw useful and ornamental working.—Address, stating terms and reference A. M. Office of "The Builder."

TO DECORATORS.
WANTED, a MAN thoroughly qualified to TAKE CHARGE of the WORKING DEPARTMENT of a HOUSE DECORATOR'S BUSINESS. He must be a man who has been accustomed to take charge of men and to superintend first-class house decoration in all its branches. First-class references will be required.—Address, GEORGE COOPER, Northumberland Decoration Works, Newcastle on Tyne.

TO PAINTERS AND PAPERHANGERS.
WANTED, in a Shop 25 miles from London, a Man as PAPERHANGER, DISTEMPERER, and PAINTER, and competent to do the common graining and writing.—Address, stating wages, &c. K. 128, Grange-road, Bermondsey.

WANTED, a First-class WORKING FOREMAN of MASONS, one that can be well recommended and capable to con. uand two or three men.—Application to be made to X. X. No. 11, Drew's cottages, Twickenham.

WANTED, by a House in the CEMENT and LIME TRADE, a TOWN TRAVELLER. One who has a connexion amongst the higher class of builders, and who understands bookkeeping, will be preferred.—Address (post-paid) to B. A. Office of "The Builder."

WANTED, for a PERMANENCY, a good PLUMBER and GASFITTER. Able to fill up time at painting, &c. 27s. shillings per week for a good, steady man.—Address, Messrs. R. & E. TAYLOR, Plumbers, &c. Tunbridge Wells.

TO ARCHITECTS' AND SURVEYORS' ASSISTANTS.
WANTED, for a permanency, in an Architect and Surveyor's Office, a thoroughly qualified ASSISTANT. Must be a good draughtsman, well up in general design and construction, must have a thorough knowledge of quantities and surveyors' accounts, and be a good and expeditious penman.—Apply, stating terms and giving references, to W. MANSFIELD, Kington, Herefordshire.

TO BUILDERS' FOREMEN.
WANTED, an active intelligent MAN, a Carpenter by trade, to superintend the erection of some buildings in the country.—Address, stating age, salary, and where last employed, to A. M. A. Office of "The Builder."

BRICKFIELDS, NORTH HYDE NEAR SOUTHALL.

BRICK BURNING, saving Two-thirds of the Fuel—HOFFMAN'S PATENT ANNULAR OVENS, for the continuous burning of Bricks, Tiles, Pottery, &c. can be seen in action, and every information obtained on application to Mr. H. CHAMBERLAIN, 3, St. John's, Wakefield, Yorkshire.

TO BRICKMAKERS.—All Parties who BURN BRICKS or LIMERS are invited to inspect the NEW MODE of SETTING, invented by Mr. ROBERT WHITE, and which may be seen in operation at the Brickfield of
J. B. WHITE & BROTHERS, Erith, Kent.
The advantages of it are as follow:—
1st. Near two-thirds of the fuel is saved in stocks, and the yield of fine bricks is increased from 40 to 80 per cent. in the total make, which in itself represents a large permanent saving.
2nd. The bricks are made of a superior quality, and will consequently serve to give them a considerable additional value in the market over common stocks.
Licences for use of the Patent granted to Brickmakers, on application to the Patentees, 17, Montague street, Westminster.

BURHAM BRICK, LIME, and CEMENT COMPANY, BURHAM WHARF, BELVIDERE ROAD, LAMBETH. OCTAVIUS N. SIMPSON, STAMFORD;
and see Specimens at the Office of
Messrs. PINDER SIMPSON & SONS, 29, Savile-row, London, and at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect colite) is raised in blocks of any portable size, and is about four feet thick in the bed. It will stand ANY WEATHER, is more used for sea-walls and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the Kingdom.
*** The above WEATHER STONE is 1s. 9d. per cubic foot, delivered in London.

RED MANSFIELD STONE
WHITE MANSFIELD STONE.
YELLOW MAGNESIAN or BOLSOVER LIMESTONE.
Consigned in railway trucks, direct from the Quarries, in blocks not exceeding twelve tons; or worked at the Quarries and delivered free from any station by any railway company.

3s. 9d.

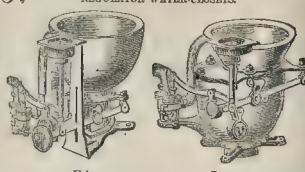
INTERNATIONAL EXHIBITION, 1862.

CLASS 35, NO. 6849.

The only Medal "for Stone Ware" has been awarded to

DOULTON & WATTS, LAMBETH POTTERY,

LONDON.



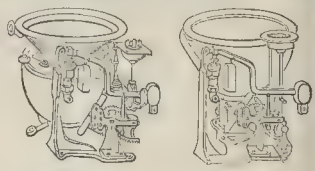
In expectation of a greatly increased sale, D. & W. have determined to introduce the annexed pattern of their ENAMELLED STONEWARE CLOSET-PANS, at the price of the commonest description of earthenware.

Experience has shown that this shape is the most simple and efficient, and that in strength, durability, and cleanliness it cannot be surpassed by the most expensive closets.

FIGURE D STONEWARE CLOSET PAN AND TRAP, 3s. 9d. COMPLETE.

J. TYLOR & SONS' PATENT

REGULATOR WATER-CLOSETS.



Valve. Pan.

The Regulator Valve gives perfect control over the supply of water to each closet, so that, however small the fall of water, perfect flushing is insured. Any number can be worked by one supply pipe. No intermediate cocks, or valves required. The Closets can be seen in action at the Manufactory, and Illustrated Catalogues had on application to the Manufacturers, J. TYLOR & SONS, Warwick lane, [illegible] street London.

GUEST & CHRIMES, FOUNDRY and

GENERAL BRASS WORKS, Rotherham; and 37, Southampton-street, Strand, London, W.C.

Lord's Hotel, Mr. THOMAS BEGGS.

ESKHOLME'S PATENT PNEUMATIC REGULATOR and VALVE CLOSET.

Suitable for first and second class houses, being most efficient and simple, free from all smell, and requires no cisterns, service boxes, cranks, wires, or levers, but is complete in itself ready for attachment to any ordinary house service pipes. It is supplied in three qualities, all equally efficient, differing only as to the style of fitting up. A second quality is also manufactured. The Regulators are usefully applied to the ordinary Pan Closet when dispensing with all cisterns, service boxes, levers, cranks, wires, &c. The Regulator is supplied separately, as well as connected to ordinary direct Service Main Cottage Water Closets.

Chrimes's Patent High Pressure Single and Double Loose Valve and Screw Down Cocks; Improved Self-acting and Pull Water Closets; Patent Absolute Water Waste Preventer; Plumbers' and Gas-Fitters' Brass Work of every description. Drawings, Descriptions, Prices, and Testimonials will be forwarded per post on application as above.

UNDERHAY'S PATENT

REGULATOR CLOSETS for constant or intermitting supply, dispensing with Cisterns, Service Boxes, Valves, Levers, Cranks, &c. &c. Much time is saved in fixing, and a better flush of water obtained in use.

Pan, Valve, Self-acting, and Servants' Closets on this principle, may be seen at the Works. They are very cheap, their efficiency is guaranteed, 50,000 of them have been sold, and no instance of failure has occurred

TO ARCHITECTS, BUILDERS, PLUMBERS, &c.

In consequence of the BANKRUPTCY of the late firm of C. BOTTEN & SON,

F. G. UNDERHAY

now manufactures on HIS OWN ACCOUNT his Patent Regulator Water-Closets, Valves Gas Meters, &c. on the same premises.

CRAWFORD PASSAGE, CLERKENWELL, LONDON, E.C.

NORWICH UNION FIRE INSURANCE SOCIETY.

NOTICE.—CHRISTMAS RENEWALS.

Mercantile and Dock Insurances at the reduced rates.

The business of the Company exceeds 70,000,000*l*.

The duty paid to Government for the year 1862 was 85,062*l*. and the amount insured on farming stock 10,088,832*l*.

A bonus of three fifths of the profits periodically made to parties insuring, who have thus from time to time received a sum amounting in the aggregate to 440,000*l*.; and the Society now holds a LARGE RESERVE in addition to a future Bonus.

The rates of premium are in no case higher than those charged by the other principal Offices making no returns to their insurers.

Insurances against Loss by Fire are effected by the Phœnix Company upon every description of Property, in every part of the world, on the most favourable terms.

The promptitude and liberality with which its engagements are always met by this Company are well known; and the importance of its relations with the public may be estimated from the fact that since its establishment it has paid more than Eight Millions Sterling in discharge of Claims for Losses by Fire.

Insurances with this Company expiring at Christmas must be renewed within fifteen days thereafter, or they will become void.

Receipts are now ready at the principal Offices, Lombard-street and Charing-cross, and with the respective Agents throughout the United Kingdom.

SOUTH NORWOOD, SURREY.

MESSRS. BLAKE will SELL by AUCTION, upon the PREMISES, Pascall's Pottery, near the Norwood Junction Station, on TUESDAY, JANUARY 12th, at TWELVE for ONE o'clock precisely, the First Portion of the STOCK and MACHINERY of the Company, consisting of 15 lots of capital pipe moulding, loading, and other machines, a quantity of pipes (from 3 to 12 inches) 12,000 paving tiles, 25,000 plain, pan, and ridge tiles; 3,000 feet of patent ridge, 50,000 kiln, stock and place bricks; 1 powerful working horse, cottage furniture, and sundry effects. Sale and garden pots, two prize drain-pipe and tile machines, by Williams, Bedford; a nearly new 8-horse horizontal steam-engine, with boiler, by Rawlings & Sims; pair of genuine 4-year-old Suffolk mares, and three with their waggons and gear, a small lot of timber, Scottish oak and elm, ash and beech plank, limetree board, deals, boards, mahogany, sycamore, walnut, blue birch, walnut, and other woods. Four powerful Cart-horses, harness, &c.—To be viewed two days prior and morning of sale. Catalogues had upon the Premises, and of the Auctioneers, No. 9, Bridget-street, Fenchurch-street, E.C.

REIGATE, SURREY.—Highly Valuable Building Land, near Crookham Hill, by

MR. THOMAS PAGE, under Instructions from the Proprietors, at the WHITE HART HOTEL, Reigate, on TUESDAY, JANUARY 19, at TWO o'clock precisely (unless previously disposed of by private treaty, of which notice will be given), in Two Lots, a valuable FREEHOLD ESTATE, containing 2a. 3r. 12p. or thereabouts, free from tithe and land tax. This property is delightfully situate on a commanding eminence, next to Rockhill and the English Rock, at the eastern entrance to the town of Reigate. The position of the land is eminently qualified for the erection of a mansion, or of villa residences, and the views from the same, of the Vale of Holmesdale, the valley of the Weald of Surrey and Sussex, and the picturesque scenery of Reigate Park, and the surrounding beautiful country. The property will be sold with the first-class cottage and premises and will be approved to purchasers each having an extensive frontage. One plot will be sold and marked for the erection of a first-class villa. The soil is admirably adapted for building, and a supply of excellent water by the Reigate Water Company will be available. The nearness of Reigate and Redhill Stations, one of the best in all its character.—Lithographic plans are being prepared, at the Inn, with particulars, terms, and conditions precisely as are at the Estates' Gazette Office, Fleet-street, E.C.; Greyhound and King's Arms Hotels, Croydon; King's Head, Epsom; Red Lion, Dorking; King's Head, Horsham; Crown, East Grinstead; Market Hall, Redhill; of Messrs. CHARLES MORRISON, Esq. Solicitor, Reigate; and of Mr. THOMAS PAGE, Surveyor and Valuer, Donyng's-place, Redhill.

STATION ROAD, REDHILL, REIGATE.—Valuable Leasehold Estate.

MR. THOMAS PAGE is instructed by the Proprietor to submit to PUBLIC AUCTION, at the WHITE HART HOTEL, Reigate, on TUESDAY, JANUARY 19, at TWO o'clock in the afternoon, a Highly Important LEASEHOLD ESTATE, admirably situate on the corner of the Redhill and Reigate Station road, having a frontage to the Station road of upwards of 200 feet, and a depth of 200 feet, comprising Seven detached Villa Residences, all built upon ground entirely new, and in the most substantial manner. The houses are let to unexceptionable tenants, and each produces a rental of £40 per annum, the ground rent being only £3 3s. per annum. The whole of the houses are in perfect repair, and have recently been put into thorough sanitary condition. Also, a range of Stabling, with coach-house, harness-room, loft, and two commodious lock-up coach-houses, with a capital supply of excellent water. The whole of the premises are held for a long term of years, at a low ground-rent, and will be sold in one lot, or divided and submitted separately. A portion of the purchase-money may, if desired, remain on mortgage. A lease will be granted direct from the freeholder for a term of nine-and-nine years from Lady-day, 1863, at a ground-rent for the whole estate, of 7l. 10s. per annum. The railway facilities of Redhill are becoming increased, as regards the number of trains at that station, and the value of property in the neighbourhood has of late years greatly increased. Plans and particulars may be had 10 days prior thereto, at the Estates' Gazette Office, Fleet-street, E.C.; at the Greyhound and King's Arms Hotels, Croydon; King's Head, Epsom; Red Lion, Dorking; King's Head, Horsham; Crown, East Grinstead; Market Hall, Redhill; of Messrs. C. & J. ALLEN & SONS, Solicitors, Carlisle-street, Soho, W.; and of Mr. THOMAS PAGE, Surveyor and Valuer, Donyng's-place, Redhill.

NORTH LONDON RAILWAY.—Extensive and Important Sale of Materials.

MESSRS. KENNEDY & BONNY will SELL by AUCTION, by order of the Directors of the North London Railway Company, in the Large Room at the "Spread Eagle" Tavern, near Broad-street Station, on the 6th, 7th, 13th, and 14th days of JANUARY, 1864, at TWELVE for ONE o'clock each day, the MATERIALS, FIXTURES, and FITTINGS of the Buildings at the Goods' Depôt, Cow-cross-street, Hatton-garden, Farringdon-street, and Skinner-street, Clerkenwell, comprising about Ninety Houses and Shops, situate in Worship street, Bateman's-row, Norfolk-street, Holywell-lane, Old-street road, and Kingsland-road (including the Punch and Bull Tavern), the King Arthur (late Marsh), and several Factories and Warehouses, comprising stock bricks, fir and oak timbers, floors, sashes, doors, shop-fronts, pubic lamps, iron railings, lead and other pipes and gutters, about 14,000 feet stoves, mahogany and other fixtures and fittings, paving and kerb stone, granite pitchers, stable fittings, &c.—May be viewed the day prior, and Catalogues had at the Auctioneers' Offices, Camden-town, and at Kingsland-gate.

MESSRS. KENNEDY & BONNY will SELL, early in JANUARY, the FIXTURES, FITTINGS, and FURNITURE of the Plough Tavern, Shoreditch, and the King John (Jem Mace's).

CHILD'S HILL, FINCHLEY ROAD.—Valuable Lease of a Brick-field, Free-and-House, Stabling for Twenty-five Horses, Hay and Straw House, Office, &c.

FREDERICK KING will SELL by AUCTION at the MART, opposite the Bank of England, on MONDAY, JANUARY 18th, 1864, at ONE precisely, the valuable LEASE, for an unexpired term of Nine Years, of the LITTLE TEMPLE PARK BRICKFIELD, one mile from the Finchley-road Station of the North London Line, with foreman's house, stabling for twenty-five horses, chaff and straw house, &c. The estate possesses an inexhaustible supply of excellent brick earth, and is abundantly supplied with water. The purchaser will have the option of taking the prepared clay, shed, barge, and the entire capital in work and in mould complete, &c. either by valuation or at a price to be named at the sale, as he may elect.—Particulars may be had of CHARLES SAWBRIDGE, Esq. Solicitor, Wood-street, Cheapside; of Messrs. HARDING, PULLEIN, WHINNEY, & GIBBONS, 3, Bank buildings; at the Mart; and at the Auctioneer's Offices, Pope's Head-alley, Cornhill, E.C.

CHILD'S HILL, FINCHLEY ROAD.—700,000 Bricks, Plant of a Brick-yard and Contractor, Thirteen Horses, Harness, Carts, Chaff, &c.

FREDERICK KING will SELL by AUCTION, at the Little Temple Park Brickfield, Child's Hill (one mile from the Finchley-road Station on the North London Line on WEDNESDAY, JANUARY 20th, at TWELVE, in Lots, 700,000 new BRICKS, together with the PLANT of a BRICK MAKER and CONTRACTOR, including the well-known and powerful horses, short harness, 15 brick and dobbin carts, light cart, a four-wheel chaise, carpenters' benches, 70 10-feet iron working plates, 3 barrows, &c. &c. Also a superior 2-year-old filly, open to any public exhibition for trick and the usual ingredients of a brickfield.—Catalogues may be had of Mr. WILLIAM NASH, the Foreman, on the Estate; and at the Auctioneer's Offices, Pope's Head-alley, Cornhill, E.C.

BUILDING MATERIALS.

MR. C. F. SMYRK will SELL by AUCTION, at MAIDENHEAD PLACE Old Street, near The Nelson, on MONDAY, 18th JANUARY 18th, at TWELVE for ONE precisely, the MATERIALS of a superior thirty leads of large number of massive flooring and landing boards, doors, sashes, &c., other fittings, deals, battens, and stock bricks. The whole are of recent erection, and of the best description.—Catalogues may be had on the Premises, two days prior, and of the Auctioneer, Newington Green.

GROVE LANE, CAMBERWELL, Superior BUILDING MATERIALS, and the large LEAD CISTERNS.

MR. C. F. SMYRK will SELL by AUCTION, on the PREMISES, as above, on WEDNESDAY, JANUARY 19th, at TWELVE for ONE precisely, the large and valuable STOCK of BRICKS, comprising about 200,000 stock, place, and pan tiles, 1,000 feet of cast-iron rain-water pipes, long and short lengths, with the necessary heads, shoes, and bends, 1,000 yellow deals and battens, 1,000 feet of elm, ash, and beech plank, limetree board, mahogany, and Spanish mahogany, Riga wainscot, white and

BY Order of the Secretary of State for India in Council.—Notice is hereby given, that TEN JUNIOR APPOINTMENTS in the Engineer Establishment of the Department of Public Works in India will, in the year 1864, be open to PUBLIC COMPETITION.

A Competitive Examination will, accordingly, be held in this Office in the month of JUNE next. Full printed particulars of the conditions on which Candidates will be admitted to the Examination may be obtained at this Office, on application, either personally or by letter, addressed to the "Under Secretary of State for India," India Office, London, S.W.

India Office, 10th July, 1863.

BY ORDER of the SECRETARY of STATE for INDIA in COUNCIL.

Notice is hereby given, that TWENTY-FIVE APPOINTMENTS in the UPPER CLASS of the ELECTRIC TELEGRAPH DEPARTMENT in India will, in the year 1864, be open to PUBLIC COMPETITION.

A Competitive Examination will, accordingly, be held in this office in the month of MAY next. Full printed particulars of the conditions on which candidates will be admitted to the Examination, and also respecting the nature of the Appointments to be competed for, may be obtained at this Office, on application, either personally or by letter, addressed to the "Under Secretary of State for India," India Office, London, S.W.

November 20th, 1863.

THE METROPOLITAN BUILDING ACT, 1855. Section 33.—The Institute of British Architects hereby give notice, that an EXAMINATION of Persons desirous of obtaining a CERTIFICATE of COMPETENCY to perform the duties of DISTRICT SURVEYOR will take place at the Rooms of the Institute, No. 9, Conduit-street, Hanover-square, W. on FRIDAY, the 29th day of JANUARY, at TEN o'clock in the forenoon. Persons desirous to be examined must, on or before TUESDAY, the 19th day of JANUARY, send an application, which must be accompanied by a statement, according to a form to be previously obtained at the Rooms of the Institute.

Signed, JOHN P. SEDDON, } Hon. Secs.
CHAS. FORSTER HAYWARD, }

Conduit-street, January 5th, 1864.

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 72—74, Bishopsgate-street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Medal Ranges and Stoves, Register Grates, and Cooking Utensils, to meet the great public demand; and also for the consequent more extensive execution, by the manufacturers themselves, of all descriptions of hot water, bath, laundry, and steam work.

72—74, Bishopsgate-street Within, November, 1863.

NOTICE is hereby given, that the PARTNERSHIP lately subsisting between the undersigned Nancy Armitage and George Armitage (as Executors of John Armitage, deceased) and between the undersigned Nancy Armitage, George Armitage, William Armitage, John Armitage, and Henry Armitage, or some of them, in the businesses of Stone-merchants and brickmakers, or any other business or businesses carried on at Robin Hood Quarry and Thorpe Quarries, both in the parish of Rothwell, in the county of York, or at any other place or places, under the style or firm of "George Armitage & Brothers," or any other style or firm, was this day DISSOLVED by mutual Consent. And that all debts due to and owing from the late Firm will be received and paid by the said George Armitage alone, whose receipt shall be a sufficient discharge for the same.—Dated this 31st day of December, 1863.

her
Witness to the signatures of all the parties,— NANCY + ARMITAGE.
mark.
J. C. TURNER, Solicitor, Rothwell. GEORGE ARMITAGE.
THOMAS CLARK, his Clerk. WILLIAM ARMITAGE.
JOHN ARMITAGE.
HENRY ARMITAGE.

GEORGE ARMITAGE (Partner in the late firm of GEORGE ARMITAGE & BROTHERS) begs respectfully to thank Customers and Friends for their past support, and to inform them that he intends henceforth to carry on BUSINESS as a STONE MERCHANT in all its branches, at ROBIN HOOD and THORPE-LANE QUARRIES; and he solicits future orders, which shall be punctually attended to, and be executed in such a manner as to insure approbation.—Address, GEORGE ARMITAGE, Robin Hood Quarry, Lofthouse, near Wakefield.

Robin Hood Quarry, January 1st, 1864.

JOHN ARMITAGE, WILLIAM ARMITAGE, and HENRY ARMITAGE (Partners in the late firm of "George Armitage & Brothers"), beg respectfully to thank their Customers and Friends for their past support, and to inform them that they intend henceforth to CARRY on BUSINESS in PARTNERSHIP as STONE MERCHANTS, in all its branches, at the OLD ROBIN HOOD QUARRY, under the firm of JOHN ARMITAGE & BROTHERS; and they solicit future Orders, which shall be punctually attended to, and be executed in such a manner as to ensure approbation.—Address, JOHN ARMITAGE & BROTHERS, Robin Hood Quarry, Lofthouse, near Wakefield.

Robin Hood Quarry, January 1st, 1864.

CHATHAM HOUSE COLLEGE SCHOOL, Ramsgate.—The TERM for 1864 will commence JANUARY 28th. A Prospectus of Terms (which are moderate) and further information may be obtained of the Rev. the PRINCIPAL.—Four Boys from this School passed the Senior Oxford Local Examination in June last, all of them in Honours.

COMPETITIONS.

TO ARCHITECTS.—The Commissioners of her Majesty's Works and Public Buildings give notice that they are prepared to receive DESIGNS from Architects for TWO NEW MUSEUMS, to be erected on part of the land at South Kensington recently purchased by the Government, and used in 1862 for the International Exhibition. Plans of the ground, together with a statement of the premiums and other particulars, will be forwarded to Architects on application by letter, addressed to the Secretary, at Her Majesty's Office of Works, 12, Whitehall-place, London.

January, 1864.

CONTRACTS.

TO BUILDERS and OTHERS.—TENDERS are required for COMPLETING, fit for occupation, the CARCASES of FOUR Houses, situate and being Nos. 9 to 12, in Lawn-terrace, Lee, Kent, near the Blackheath Railway Station, on the North Kent Railway; and the drawings, specification, and contract for these works can be seen at the Offices of Mr. F. F. THORNE, Architect, at No 4, Corbet-court, Gracechurch-street, London, and Lee-road, Lee. The Tenders are to be delivered at No. 4, Corbet-court, Gracechurch street, London, at TWELVE o'clock, on MONDAY, the 25th instant; and the lowest or any other Tender will not necessarily be accepted.

January 6, 1864.

HAILEYBURY COLLEGE WATER-WORKS.—TENDERS WANTED.—The Council of Haileybury College are desirous of receiving TENDERS for the following WORKS required at Haileybury College, viz. the Providing, Delivering, Laying, and Jointing the necessary Mains, Services, and Fire Plugs.—The plans and specification will lie for inspection of contractors at the Office of JOSIAH FORSTER FAIRBANK, C.E. No. 20, Parliament-street, Westminster, from TWELVE to FOUR each day, from the 11th to the 15th day of JANUARY instant, on which day Tenders should be sent in to the Rev. LEWIS DEEDES, Hon. Secretary, Bramfield Rectory, Hertford, endorsed "Tender for Mains." The Council do not undertake to accept the lowest or other Tender. Copies of quantities, &c. can be obtained of the Engineer.

20, Parliament-street, Westminster, 7th Jan. 1864.

TENDERS are required for GENERAL REPAIRS to Twenty HOUSES in Shadwell, E.—For specification and particulars, apply at the "Apollo," Francis street, Tottenham-court road, between NINE and TEN p.m. on TUESDAY, 12th of JANUARY.

TO BUILDERS.—CHINNOR, OXON.—Parties willing to CONTRACT for the RESTORATION of, and other WORKS at Chinnor Church, in the county of Oxford, are hereby informed that the drawings, specifications, and conditions of contract thereof, may be seen at the National School-room, Chinnor, on and after the 14th instant.—Tenders properly endorsed and sealed, to be sent to the Rev. F. BUTLER-SHAW, Chinnor, Tetsworth, on or before the 30th instant.—The Committee do not bind themselves to accept the lowest or any other Tender.

EDWARD BANKS, Architect.

Wolverhampton, January 6th, 1864.

CONTRACTS.

WAR DEPARTMENT CONTRACT.—NOTICE to BUILDERS.—TENDERS are required for ERECTING a READING-ROOM, &c. at the New Barracks, Gosport.

Parties desiring to Tender for the erection of these Works must leave their names at the Royal Engineers' Office, Gosport, on or before the 11th day of JANUARY, 1864, and pay the sum of Ten Shillings and Sixpence, for the bills of quantities, which will be forwarded to each party as soon as prepared by the Government Surveyor.

The Secretary of State does not bind himself to accept the lowest or any Tender.

Royal Engineer Office, Portamouth, 23rd December, 1863.

TO BUILDERS.—WESTGATE CHAPEL, Heckmondwike.—TENDERS are required for the whole or any part of the WORKS in REBUILDING the CHAPEL now known as the "Lower Chapel," Heckmondwike. Drawings, specification, and conditions of Contract may be seen in the Vestry of the present Chapel from MONDAY, the 11th of JANUARY next, to the SATURDAY following, both inclusive. Bills of quantities may be obtained, without charge, after MONDAY, the 11th of JANUARY, upon application at our Offices in Bradford, No. 18, Kirkgate. Sealed Tenders to be delivered to Mr. FRANK SYKES, of Cleckheaton, before ELEVEN A.M. on MONDAY, the 18th of JANUARY. The Committee will not be bound to accept the lowest or any Tender.

PAULL & AYLIFFE, Architects.

India Buildings, 20, Cross-street, Manchester,
Dated 22nd December, 1863.

TO BUILDERS and OTHERS.—Persons willing to submit TENDERS for BUILDING a new RECTORY-HOUSE and OFFICES at Elmswell, Suffolk, on a site about half a mile from the Elmswell Station, on the Haughley and Bury Railway, are informed that the plans and specifications will lie for inspection at the Lion Inn, at Elmswell, from MONDAY, the 11th JANUARY, to SATURDAY, the 23rd, inclusive. Tenders, upon forms supplied, to be forwarded by post, prepaid, on or before MONDAY, the 25th of JANUARY, addressed to the Architect, Mr R. J. WITHERS, 21, Doughty-street, London, W.C. and from whom any further particulars may be obtained. The lowest or any Tender will not necessarily be accepted.

W. H. C. LUKE, Rector.

Elmswell Rectory, Woolpit, Suffolk, December 26, 1863.

NORTHAMPTON NEW TOWN HALL. DRAWINGS and Specifications for Furniture and Fittings for the New Town Hall, Northampton, prepared by the Architect, E. W. Godwin, Esq. may be seen at the Office of the Town Clerk, Townhall, Northampton. Persons desirous to CONTRACT for MAKING such FURNITURE and FITTINGS must send Sealed Tenders to the Town Clerk's Office, addressed to the Building Committee, on or before the 12th day of JANUARY, 1864.—By order,

JOHN JEFFERY, Town Clerk.

Northampton, 23rd December, 1863.

LANCASHIRE and YORKSHIRE RAILWAY.—The Directors are prepared to receive TENDERS for the CONSTRUCTION of a BRANCH RAILWAY from Lockwood to Meltham, near Huddersfield. Length about 3¼ miles.—Plans and specifications may be seen, and forms of Tender obtained at the Engineer's Office, Hunt's Bank, Manchester, on and after MONDAY, the 4th JANUARY proximo, and Tenders, properly endorsed and addressed to the Directors, must be in the hands of the Secretary not later than MONDAY, the 15th FEBRUARY, 1864.

Manchester, December 18, 1863. WM. S. LAWN, Secretary.

TO ENGINEERS, COPPERSMITHS, &c. The Guardians of the Poor of the Whitechapel Union will meet in their Board Room, at the Workhouse, on TUESDAY, the 12th day of JANUARY, 1864, at SIX o'clock in the Afternoon, to receive TENDERS for erecting and fitting up certain BOILERS and COOKING APPARATUS at their Industrial School, Forest-lane, Stratford, Essex. The Specification, and Plans may be inspected on application to the Master at the School as above, from whom forms of Tenders may be obtained; no others than those on the printed forms to be supplied will be noticed. And the Guardians do not engage to accept the lowest or any Tender.

G. ADAMS FARR, Clerk.

Clerk's office, Workhouse, 28th December, 1863.

KEIGHLEY and WORTH VALLEY RAILWAY.—The Directors are prepared to receive TENDERS for the EXECUTION of the WORKS required in the CONSTRUCTION of the above RAILWAY.—Plans, sections, drawings, and specifications may be seen, and schedules and forms of Tender obtained, upon application to J. MCLANDSBOROUGH, Esq. Civil Engineer, 23 and 24, Queensgate, Bradford. Tenders are to be delivered as addressed, on or before MONDAY, the 11th JANUARY next, 1864. The Directors do not hereby pledge themselves to accept the lowest or any Tender.—By order of the Directors,

JONATHAN GILL, Secretary.

Oakworth, December 22, 1863.

BOARD of WORKS, WHITECHAPEL DISTRICT.—A meeting of this Board will be held on MONDAY, the 18th day of JANUARY, 1864, at SIX o'clock in the evening, at the Office, 15, Great Alie street, White hapel, to receive TENDERS for the CONSTRUCTION of a BRICK SEWER in Dock street, Whitechapel.—Plans, sections, and specifications may be inspected, and further particulars, with printed forms of Tender obtained, on application to Mr. FRICKER, Surveyor, between the hours of TEN and FOUR, at the Office of the Board. Sealed Tenders, in which a 10l note is to be enclosed, must be delivered at the Office previous to the hour of meeting; and any Tender which is not upon the form prepared by the Board, and duly signed by the person or persons tendering, will be rejected. Persons tendering, or their representatives, are required to attend the meeting of the Board. The Board do not bind themselves to accept the lowest or any Tender.

ALFRED TURNER, Clerk to the Board

15, Great Alie street, Whitechapel, 9th Jan 1864

TO BUILDERS and OTHERS.—Parties desirous of TENDERING for the ERECTION of a MUSIC-HALL, on a plot of land in Commercial-street, Whitechapel, can inspect the Plans and specifications, and obtain bills of quantities, on application to the Architect, Mr. R. H. HODGES, 10, Walbrook, Mansion House, on and after MONDAY, 11th instant, between the hours of Ten and Five o'clock.

STONE MERCHANTS and QUARRYMEN.
Cargoes shipped to order from Caen by any port. Contracts taken for any quantities.
Office—10, Three Crown square, Southwark.

LITTLE CASTERTON FREESTONE.
Apply, for prices, &c. to
OCTAVIUS N. SIMPSON, STAMFORD;
and see specimens at the office of
Messrs. PINDER SIMPSON & SONS, 29, Sackville, London, and at the Museum of Practical Geology, Jermyn street, W.
This stone (which is a perfect oolite) is raised in blocks of any portable size, and is about four feet thick in the bed. It will stand ANY WEATHER, is much used for water-work, and for the building and decoration of churches. When used as ashlar work it is not necessary to sheet the beds. It can be easily sawn, tooled, or worked to any moulding, and is wrought at a cheaper rate than any stone in the kingdom.
*** The above WEATHER STONE is in 3d. per cubic foot, delivered in London.

ROCHE ABBEY QUARRIES.—STONE
Raised from the above Quarries, in blocks of all sizes, consigned in trucks from the Quarries. Worksby, or Maltpreach Railway Station, or worked at the Quarries, and delivered at either of the above stations without injury.—Full particulars as to prices, &c. may be had on application to Mr. TIPLET, Sandbeck Office, Tickhill, near Doncaster.

Grindstones, Steps, Sills, Coping, Landings, Paving, and all descriptions of Yorkshire Block. Cargoes shipped direct from the Quarries Prices and specimens forwarded on application

TISBURY STONE.
The WARDOUR (CHILMARK) and TISBURY STONE COMPANY, Limited,
Are prepared to execute orders to any extent for their TISBURY STONE.—This is a close, fine-grained Stone, of a beautiful colour, possessing all the qualities of the best Portland, in which range it is placed geologically.
It will supply the long-wanted desideratum of the Architect, Builder, and Sculptor, as the Stone is a first-class Weather Stone, easily worked, and takes a fine arris; and is eminently adapted for carved mouldings, high class architecture, and works of art, requiring only to be known to become the
STONE OF THE DAY.
Specimens, Price, &c. may be obtained of
SAMUEL TRICKETT,
General Stone Merchant, Millwall; or at the Offices of the Company, 3, Adelaide-place, London Bridge

WILLINGTON STONE WHARF,

SMOKY CHIMNEYS.

S. DEACON

Respectfully invites the attention of Architects, Builders, &c. to his

PATENT LOUVRE CHIMNEY CAP,

which has been in use some time with perfect success, many curing chimneys where other caps have been of no avail.

The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of displacing it; an increased up current, and the impossibility of a down one.

Prospectus forwarded on receipt of Postage Stamp, by

S. DEACON,

59, ALMA STREET, HOXTON, N.

MANUFACTORY:

HEMSWORTH STREET, SAINT JOHN'S ROAD, HOXTON, N.

SIMPLICITY, UTILITY, ECONOMY, AND DURABILITY.

THOMAS PUGH & CO.'S NEW PATENT ECONOMIC SELF-ADJUSTING MORTISE AND RIM LOCK FURNITURE.

J. B. SCAMMELL & CO. (late Thomas Pugh & Co.)
WHOLESALE IRONMONGERS,
13, KING STREET, SNOW HILL, LONDON.

NUT PLATE.

We invite particular attention to the PATENT LOCK FURNITURE, which we do not hesitate to say is the most perfect article now manufactured, great improvements having been recently made in it. It has been extensively used in Public and Private Buildings, in Her Majesty's Pavilion and Camp at Aldershott—alone, many hundred sets without one single failure. It is applicable to all Locks and Latches, both Rim and Mortise, and effects a most secure fastening, without any screw in the back of the knob. Perfect action guaranteed in both Locks and Furniture, if the Locks are of our own manufacture.

Now rich Designs in Glass, China, Brass, Bronzed, Gilt, Carved Woods, Inlaid, &c. &c. or to any Design.

THIS FURNITURE MAY BE HAD WITH PLATES OR NUTS.

A most complete and extensive stock of every description of Locks, Latches, Brass Foundry, and Ironmongery, required for Buildings, of the best quality manufactured, at the lowest wholesale prices.

. Illustrations and Particulars sent on application.

WAREHOUSES FOR NAILS, PIPES, GUTTERS, &c. IN ST. JOHN'S COURT.

EXHIBITION PRIZE MEDAL, 1862, AND MEDAL OF ROYAL AGRICULTURAL SOCIETIES OF ENGLAND AND IRELAND.

MUSGRAVE'S PATENT STABLE and HARNESS FITTINGS.

"MUSGRAVE'S PATENT HARMLESS LOOSE BOXES.

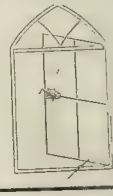
MUSGRAVE'S PATENT IRON COW STALLS and PIGGERIES.

And steels who have not seen these fittings are requested to write for engravings, as they are unlike those of any other maker, and were admitted to excel all the work of their class in the Exhibition.

They can be seen in first-class stables in almost every county in England; and MUSGRAVE, BROTHERS, are now fitting several very large establishments under direction of London architects, noted for employing only what is the best of its kind.

Musgrave's Patent Slow-combustion Stove

Is the nearest approach to Warming by Hot Water. It will burn in churches from Saturday till Sunday evening, without attention during the hours of worship. In halls will burn day and night for weeks, with little care. Capable of warming a large apartment for twenty-four hours, at a cost of 2d.; and deserves of special attention because of its safety, healthfulness, durability, and extreme simplicity.—For full particulars apply to



MUSGRAVE, BROTHERS, Ann-street Ironworks, Belfast.

BURT & POTTS'

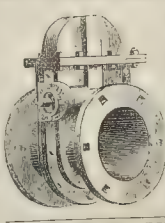
STAMP END WORKS, LINCOLN; AND 78, LOMBARD STREET, LONDON.

Descriptive, Illustrated, and Priced Catalogues, Freeper Post.

FIRE-PROOF CONSTRUCTION.—FOX & BARRETT'S PATENT.

This improved system of fire-proof construction has been most successfully introduced in several of the largest and most important buildings recently erected in the kingdom, and is now in course of erection in others. The attention of Architects, Builders, and the Public is directed to the following, which are recommended to the notice of all who are interested in building, both as being the most economical and easily executed system of cast-iron girders and brackets, and as securing the great desideratum of fire-proof construction, even for ordinary dwelling-houses and domestic buildings, within the reach of every one.

Further information may be obtained of the Proprietor of the Patent,



MR. BARRETT,
12, YORK BUILDINGS, ADELPHI.

ROBERT MACLAREN & CO.

EGLINTON FOUNDRY, GLASGOW

Manufacturers of all sizes of CAST-IRON MAIN PIPES, for Gas or Water, on the IMPROVED PATENT.

GENERAL IRON FOUNDERS, GAS ENGINEERS, and WROUGHT IRON TUBE MAKERS.

REDUCED PRICES OF

LONDON.

THE INTERNATIONAL EXHIBITION PRIZE MEDAL, AWARDED 1862
ESTABLISHED 1744.
AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES.
To BUILDERS, CARPENTERS, and BLIND MAKERS.
J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his
IMPERIAL PATENT FLAX SASH-LINES,
of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

GARDNER'S SUNLIGHT GAS BURNER and FITTING ESTIMATES
Offer important advantages to Architects, Builders, and the Public generally.—GARDNER'S, No. 453, Strand, Charing-cross, four doors from Trafalgar-square, London

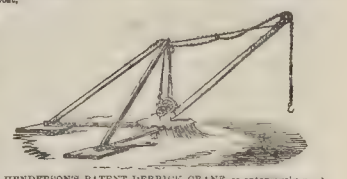
DEVAUX'S VIEILLE MONTAGNE THICK ZINC ROOFING on IMPROVED PRINCIPLES.
JAMES W. TYLER, CONTRACTOR,
12, ABINGDON STREET, and 4, WOOD STREET, WESTMINSTER, close to Victoria Tower.



RICKET'S & HAMMOND'S VENTILATING GLOBE LIGHT,
combining an agreeable method of lighting, with convenient, simple, and efficient ventilation.

The advantages attained are these—
A TOTAL REMOVAL OF ALL PRODUCTS OF COMBUSTION.
A COMPLETE DISPLACEMENT OF HEATED AND VITIATED AIR.
AND A CONSIDERABLE ECONOMY IN THE CONSUMPTION OF GAS.
A GLOBE LIGHT will consume 5 to 7 feet of gas per hour, giving as much light as an ordinary three-light chandelier, with a consumption of 18 feet per hour.
No. 5, CHANDOS STREET, CHARING CROSS, LONDON, W.C.

GAS.—SAVING OF 40 PER CENT.
NORDHOFF & CO.'S PATENT GAS CARBURETTING APPARATUS offers the following highly important Advantages to Consumers of Gas:—
1. Great Economy—a saving of at least FORTY per Cent.
2. Perfect Purity of the Carburetted Gas.
3. Threefold Increase of the Intensity of Light.
4. Simplicity and Safety of the Apparatus.
5. Certainty of Supply.
6. No Alteration in Gas-fittings required.
Sole Agent for the United Kingdom,

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with a comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

DEDICATED, BY SPECIAL PERMISSION, TO H. R. H. THE PRINCE OF WALES.

THE ART JOURNAL,

Price 2s. 6d. Monthly.

The January Number (now ready) commences a New Volume, and contains the following interesting articles, the most important of which will be continued throughout the year:—

Now ready, with 10 plates, roan tuck, price 6s. (postage 4d.)

THE ENGINEER'S, ARCHITECT'S, AND CONTRACTOR'S POCKET BOOK (LOCKWOOD'S, formerly WEALE'S) for 1864. The present volume has been considerably improved, and many new matter added
LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Now ready, 12mo. strongly bound in cloth, price 4s. (postage 4d.),

THE BUILDER'S and CONTRACTOR'S PRICE BOOK (Lockwood's, formerly Weale's) for 1864.
Revised by G. R. BURNELL, Esq. C.E.

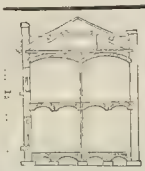
This book is the universally recognised arbitrator in the settlement of disputed accounts. Not being printed from stereotype plates year after year, as is the case with other books of the kind, errors are not perpetuated, and the opportunity is taken in every reprint to introduce current prices and other desirable improvements.
LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Just published, for 1864, price 4s. the Forty-fourth Edition of

SKYRING'S BUILDERS' PRICES, calculated from the prime cost of materials and labour, containing the whole of the Metropolitan Building Act, list of District Surveyors, and a variety of new and useful information.
Sold by SIMPKIN & CO. Stationers'-court, London; and may be had of all Booksellers.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.



ADULTERATIONS. Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Baryte from ten to thirty per cent. Others sell under the name of "Improved Zinc Paint," or as the number Two or Three qualities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

THE DENNETT ARCH.

Allowed to be the cheapest fireproof construction known, and used with the greatest success for the last ten years in the Midland Counties, and has been adopted by G. G. Scott, esq. for the New Foreign Office. It is used in any form of arch, groin or dome; turned to any breath, width, or height, forming a perfect floor and ceiling in one mass, from 9½ inches in the crown to any required thickness.

Address—A. & R. DENNETT & CO. NOTTINGHAM.

TESTIMONIAL.—"I have made use of Messrs. Dennett & Co's material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength and its extreme convenience of application. I have made use of it in positions in which I should have found it difficult to introduce any other fireproof material, and it has this advantage, that the arch is constructed of it is set entirely in the mass that they cover the space like a compact shell or inverted basin, and are, consequently, almost wholly free from lateral pressure.

"GEO. GILBERT SCOTT, 20, Spring Gardens, London."

Now ready, price 3s. a New and much improved Edition of

CHEMISTRY.

Prepared by the Late PROFESSOR GEORGE WILSON, the Work has been revised and brought down to the present state of Chemical Knowledge by his pupil, Dr. STEVENSON MACADAM.
W. & R. CHAMBERS, London and Edinburgh

The Second Edition of Mr. J. A. FROUDE'S HISTORY OF

THE REIGN of ELIZABETH, Vols. I. and II. being Vols. VII. and VIII. of "The History of England from the Fall of Wolsey to the Death of Elizabeth," may now be had
London: LONGMAN, GREEN, & CO. Paternoster-row.

Now ready, in 8vo. with numerous Diagrams, price 7s. 6d.

A HANDBOOK of PRACTICAL TELEGRAPHY.

By R. S. CULLEY, Telegraph Engineer and Superintendent.
(Adopted by the Chairman and Directors of the Electric and International Telegraph Company, and published with their sanction)
London: LONGMAN, GREEN, & CO. Paternoster-row.

Forty-fourth Edition, price 4s. bound in cloth,

LAXTON'S PRICE BOOK for 1864, for ARCHITECTS, ENGINEERS, BUILDERS, CONTRACTORS, SURVEYORS, &c. (established 1818), containing with a variety of new and useful matter, more than 50,000 Prices, embracing all the various trades connected with the operations of the Architect, Engineer, Builder, Contractor, and Surveyor; together with 10,000 useful and important Memoranda relating to the same. Also full Descriptions of various Stones for Building from the Quarries of England, Scotland, and Wales. Instructions for Estimating and Contracting; Calculations and Sketches of Cast and Wrought Iron Girders, and Columns; Hot-water Pipes and connexions; Water, Steam, and Gas Fittings, &c. &c. The whole carefully revised and corrected to date of publication.
OFFICE,—15, WARWICK COURT, GRAY'S INN, HOLBORN, LONDON, W.C.
Supplied by all Booksellers in Town and County.

NO SHUTTER BARS.

JENNINGS'S SHOP-SHUTTER SHOE.

SHOP SHUTTERS are SHOD and SECURED by the above, at HALF THE COST OF THE UNSIGHTLY AND DESTRUCTIVE SHUTTER BAR. Shops referred to in every public street in London. When ordering the above, send FINISHED THICKNESS of Shutters, and the way they go up.
Sold by all Ironmongers, and the Inventor,
GEORGE JENNINGS,
Engineering Depôt, Palace Wharf,
Stangate, Lambeth, S.

CARTS, LADDERS, BARROWS, &c.—GEORGE ELL & CO. Builders of Carts, Vans, Waggons, Trucks, and Manufacturers of Implements for Railways, Town use, Agriculture, and Exportation.

LADDERS, BARROWS, TRESTLES, STEPS, PORTABLE SCAFFOLDS,

and every description of Contractors', Builders', and Decorators' Trade Requisites.

Vans, Waggons, Dobbin and other Carts, specially adapted for exportation. Pug-mills, Jack-rolls, Trolleys, and Portable Railways. Scaffolding, Ladders, Barrows, Trestles, Steps, &c. Lent on Hire.
Price Lists on application.

GEORGE ELL & CO.
EUSTON WORKS, 366 and 368, EUSTON ROAD, LONDON, N.W.

PRIZE WAGGONS and CARTS.—HAYES & SON,
Manufacturers to Her Majesty's Board of Ordnance, and all the principal Railways in the Kingdom,
Coach and Cart Wheelwrights, Spring Van and Waggon Builders, Timber Merchants, Contractors, &c.

Manufacturers of Carts, Vans, Waggons, Trucks, and Implements for all Railways, Town use, Agriculture, and Exportation.

Contractors' and Builders' Dobbin and other Carts, Barrows; Navvy, Excavators', Crowding, and Off-bearing ditto, on the shortest notice and of the best materials; &c.

HAYES & SON,
SCOTGATE WORKS, STAMFORD.

WANTED, some good RED FACING BRICKS.—Address, giving full particulars, Mr. J. LONG, 20, Union-street, Hackney-road, N.E.

GILT BORDERINGS for ROOMS, from 1d. per foot. Best and cheapest House in London for every description of Room Bordering, Picture Frame Mouldings, and Pictures Frames of every description at the very lowest prices. Re-gilding in all its branches to the trade. ½-inch Gilt Beads, 7s. per dozen 6-feet lengths; best ditto, 12s.

59, Bishopsgate Street Without, E.C. Manufacturer, by appointment to Her Majesty's Honourable Board of Ordnance.

The Builder.

VOL. XXII.—No. 1092.

Fish Manufactories.

FISH-BREEDING as an art has been carried on in its revived state for some time in France, and is extended throughout that kingdom. In our own country it is practised in a very limited manner; but it may be pursued so advantageously and profitably that we may hope soon to hear of its more vigorous prosecution, and find an acre of water made as productive as an acre of land. An immense quantity of fish is eaten in London alone: and this quantity would be much larger but for the price at which it is sold. Left to itself, the price will become greater and greater: but let pisciculture be properly extended, and fish will be so cheapened as to place it easily within the reach of all, and increase the resources of struggling thousands. The *Times*, and other important organs of intelligence, have recently drawn attention to the subject, with special reference to the extensive establishment at Huningue, near Bâsle, for the collection and distribution of the eggs of those kinds of fish most suitable for propagation in the fresh-water streams and canals, and it has appeared to us that we may advance the subject by giving illustrations of some parts of the buildings forming that establishment.

The system of spawning fish by manipulation owes its success to the fact of the fecundation of fish-eggs being an external act,—in other words, the roe of the female is not fecundated by the milt of the male fish till after it has been deposited in its watery bed. A fisherman of the department of La Bresse, in the Vosges, one Joseph Remy, was the first in France to discern that the natural principle of fish fecundation could be easily imitated, and so be turned to profitable account in the pursuit of his business. The Chinese have long practised the art, and have carried it to such an extent as to be able to keep up a constant supply of those particular fishes which inhabit their seas and rivers, so that any quantity of this kind of food can be obtained all over the kingdom, at the rate of about threepence a stone weight. In an article on the subject in *Fraser's Magazine*, it is pointed out that—"An ingenious method of artificial hatching has been resorted to by the people of China, which is worth noting as a piscicultural novelty. These ingenious celestials carry on a business in selling and hatching fish-spawn, collecting the impregnated eggs from various rivers and lakes, in order to sell to the proprietors of canals and private ponds. When the proper season for hatching arrives, they empty the hen's egg, by means of a small opening, sucking out the natural contents, and then, after substituting fish-spawn, close up the opening. The egg thus manipulated is placed for a few days under a hen! being removed, the shell is broken, and the contents are placed in a vessel of water warmed by the heat of the sun only: the eggs speedily burst, and in a short time the young fish are able to be transported to a river or lake of ordinary temperature." Heat expedites the birth of the fish. Salmon-eggs deposited early in the season, when the temperature is high, come sooner to life than those spawned in mid-winter. Salmon have been brought to life in sixty days at Huningue; but the quickest hatching ever accomplished at the Stormontfield breeding-ponds took 120 days. The Romans achieved great wonders in the way of fish-breeding. Lucullus at one time sold his stock of fish for the sum of 35,000*l.*

To get some idea of the fecundity of fish, look at what is said concerning the herring. "The produce of a single female is (say) 36,000 eggs, but we may—and the deduction is a very reasonable one—allow that half of these never come to life, which reduces the quantity to 18,000. Allowing that this fish will be able to 'repeat the story of its birth' in three years, we may safely calculate that the breeding stock will be reduced to 9,000 individuals; and granting half of these to be females, or say, for the sake of rounding the figures, that 4,000 yield roe, we shall find, by multiplying that quantity by 36,000, the number of eggs in a female herring, that we obtain a total of 144,000,000 as the produce in three years of a single pair of that fish." Although half of these may be taken as the food of man as soon as they are large enough, there would still be left an immense breeding stock, even after all deductions for casualties had been given effect to.

Fish-breeding had been practised in Germany 100 years before Remy, and experiments in salmon-breeding had been made some years before his time by Mr. Shaw, at Drumlanrig Castle; but of all this Remy was ignorant, it seems, and went his own way in the matter. Knowing how enormously prolific all kinds of fish naturally are, he could not understand why they were yearly becoming less plentiful; but he found, first, that an immense proportion of the ova was never properly fecundated; secondly, that even if all the eggs obtained the benefit of the milt, a vast proportion never came to life, from being deposited in places where they were ultimately bereft of water; that others were eaten by waterfowl, or devoured by other fishes; and a proportion swept away to the sea, and so lost for ever. He therefore soon saw that the best way to increase the supply was by obtaining the eggs and protecting the young fish till they were able to take care of themselves. He accordingly went to work, obtained a great degree of success, and was taken up by the Government, who established Huningue, where millions of eggs are given away every year.

Mr. Frank Buckland, who devotes himself to the animal kingdom, and seems equally at home whether in attendance on a life-guardsman or a porpoise (we do not quite agree with him, by the way, in the treatment he adopted in the latter case when the patient slipped through his fingers), points out that a large number of gentlemen, proprietors of fisheries, &c., in England, are quite as anxious to take up pisciculture as the 296 applicants for ova from the French fish-breeding establishments at Huningue; nay more, that there are at this moment fish-hatching boxes either actually at work or waiting for fish ova whereon to operate, at the following places; viz., Hampton, Twickenham, Watford, Carlshorton (two in number), Farningham, the Zoological Gardens, Regent's Park, and the Crystal Palace; also near Dublin; Canterbury; Petersfield, Hants; Beyfordbury, Herts; Ashbourne, Derbyshire; Mansfield, Notts; Reading, Witney, and Woodstock; in all of which he has more or less interest; to say nothing of the larger establishments at Stormontfield, Mr. Ashworth's, Galway, and other places.

Mr. Stephen Ponder, of Hampton, and himself having undertaken to hatch fish for the Thames Angling Preservation Society, he gives the following as the result of their labours last year:—"We let loose on the shallows in the neighbourhood of Hampton, Sunbury, Walton, &c., 22,000 English trout, 6,000 Rhine salmon, 2,000 French trout, 3,000 ombre chevalier (charr), and 2,000 grayling, in all 35,000 fish; being when let loose about the size of minnows. Should there be any doubt as to whether these fish are doing well in the Thames, let me beg the reader to take a boat some warm morning next spring and paddle gently along the shallows above Hampton, and I shall be much mistaken if he does not see a considerable number of our little silver-scaled beauties darting away like water-swallows from the bank side." This is very promising; but we want the practice on a much larger scale, and we have no doubt Mr. Buckland quite agrees with us.

Let us now turn again to the establishment at Huningue, of which we give three illustrations. These do not indicate the full extent of the grounds and buildings, but convey a correct idea of the place. One represents the exterior of the offices and laboratory, the others the interior of the hall, where the eggs are kept, and the basins for the growth of the young fish.*

The establishment occupies a space of 80 acres, and the suite of buildings necessary for carrying on the business has been erected in the form of a square. They comprise a principal building, 48 metres long by 11 metres broad, and two buildings placed square with the front, at the ends, having a length of 60 metres by a breadth of 9 metres. In front two guard-houses form the fourth side of the square. At the principal entrance in the centre is a plot of shrubbery, relieved with two ponds, and behind the principal building a shed has been erected to serve as a storehouse.

The supply of water necessary for carrying on the piscicultural operations is derived from three sources,—the springs on private grounds at Huningue, the Rhine, and the Augraben stream. The water of the higher springs is directed towards the buildings through an underground conduit, whilst those rising at a lower level are used only in the small basins and trenches for the experiments in rearing fish on the outside. The waters of the Rhine, being at a higher level than the springs, can be at once employed in the *appareils* and basins. Being uncovered, however, they are easily frozen, and are besides frequently muddy and troubled. The waters of the Augraben stream which cross the grounds are of very little use. Nearly dry in summer, rapid and muddy after rain, they have hitherto served only to supply some small basins for *l'alevinage extérieur*.

In the middle of the principal building there is a pavilion, containing on the ground-floor in front the laboratory, used for such operations as require particular care, or are undertaken as experiments. Behind, on one side, is the bureau of the clerks, with the archives, library, and drawings; and on the other a room for implements and material; and between these two places there are stairs, with outlet to the court behind. The residence of the manager is on the first flat. On both sides of the central pavilion, the building, formed beneath a large open verandah, is surmounted at both ends by a small flat, where the assistant manager and *explorateur* live. In the buildings, of which the wings communicate with each other underneath the middle of the pavilion, are the arrangements for incubation. The waters of the spring enter by the end, running through three underground trenches, surmounted by higher trenches. The waters of the Rhine run along one of the sides, at their natural level, in a built trench, whilst the opposite side is edged with troughs, with falls. The reservoirs containing to a certain height the waters of the spring, allow them to fall into the higher trenches. All the *appareils* of incubation of this building preserve the primitive type of trenches in a continual stream; but in some

* See pp. 28, 29.

the ova are deposited under hurdles of glass rods.

The building to the right, on the corner of the principal edifice, is a large hall, containing the apparatus of incubation. The waters of the spring there flow into three trenches, built underground, and capable of receiving the hurdles. These trenches are surmounted through their whole length by fittings of earthenware, with falls and hurdles. The higher reservoirs contain the waters of the spring, distributed into all the troughs by pipes and cocks. At the higher end of the building are placed two small turbines, set in motion by the waters of the Rhine, which drive two pumps to raise the waters of the spring into the reservoirs. The waters of the Rhine, conducted at their natural level in a built trench, run along one of the inner sides of the building on the right, to return into the principal building and the left wing. They can, at will, be directed over the *appareils* of incubation, in case the waters of the spring should fail.

The building in line with the front, on the left, was constructed to receive at once the *appareils* of incubation, and built ponds for the trials of *élevage par la stabulation* in small spaces; also for experiments in the acclimatization of strange species of fish requiring particular care. There are placed at the higher end, two turbines with pumps, serving at once to replace for the time the turbines on the right, should the mechanism be deranged during the hatching, and to furnish a special supply for the rearing-basins.

Behind the main building a series of simple open air-ponds and running streams have been formed for the purpose of showing the various stages of growth attained in a given period by the Rhine salmon, the ombre chevalier, the trout, and other of the fishes which are of interest to the French people. These can be seen at all ages, some a few weeks old, others having attained their fourth year. We may explain here that the fish are not bred from the eggs in these outside ponds -they are only transferred to them from the basins we have alluded to, and where, of course, the temperature is a great deal higher and more conducive to the speedy ripening of the ova than it would be in the open air. At Stormontfield, again, the salmon breeding-boxes are quite unprotected, and all through the winter lie open to the frost or snow of the season; hence the ova there are not hatched under a period of one hundred days, whilst in a warmer temperature eggs have come to life in little more than half that time. We may just state here, in passing, that the breeding-ponds on the Tay at Stormontfield have been so successful as to induce the erection of others both in Scotland and Ireland.

Considering that only twenty years have expired since the re-discovery of the art by Remy, a wonderful amount of good has been accomplished in the repopulating of those streams that had become by overfishing barren of fish. Many millions of eggs are annually distributed throughout the country by the French Government; these being first collected and sent to Huningue, where they are nursed on the apparatus we have described till they are ripe enough to be transported to any required distance. The principle of fish life that has given rise to pisciculture is, as we have said, the external incubation of the eggs. From this fact has arisen the plan of manipulation, whereby the fish, after being caught, may be carried to a place of safety, and there be deprived of their eggs, which can be nursed into life under protection from all enemies. But the chief business at Huningue is the receiving and despatching of ova, few fish being bred there except by way of experiment. Persons are employed to collect the eggs from the streams of Switzerland and Germany; and these, after being kept for a time, are given to departments or persons who may require them for the stocking of rivers and canals. It is but just to state that the buildings and ponds at Huningue have been expressly designed for the purposes of pisciculture by M. Coumes, of Strasbourg.

NEW MATERIALS FOR THE LIFE OF HENRY FUSELI.*

I RESUME and conclude this week Miss Patrickson's very interesting "Ana" respecting Professor Fuseli:—

I never saw anything like professional jealousy in Fuseli, unless it was his annoyance at the excessive rage for West, just when he painted his "Christ in the Temple," and "Christ rejected." And, perhaps, I might never have known it if I had not expressed my own sentiments first. He also made use of the only light and profane expression I ever heard from him. "Have you been to see Mr. West's picture?" "Yes, sir." "Well, and it's very fine? Is it not very fine?" "I suppose so, sir." "You suppose so! Don't you know? Did you shut your eyes?" "No, sir; but I did not like it very much; and the longer I looked the less I liked it." "And what for? what fault do you find?" I told him. "Oh! so you are a critic, and have an opinion of your own! We must take care of you when you attack the President of the Academy himself!" "I didn't attack Mr. West, sir; I only answered your question, and I would have liked the picture if I could. It's a pleasure the less, you know, not liking it." "Well, I don't like it very much myself, but unless you are directly asked your opinion, you had better perhaps not say anything. Mr. West is the fashion at present; there must always be something in fashion; there have been four wonders lately for every one to talk about. First, there was—(I forget the first and second); then it was Bluebeard and the Horses;† and now it is Mr. West and Jesus Christ!"

Fuseli was exceedingly interested in Haydon; but personal feelings never interfered with his judgment of art. He liked much in the "Macbeth;" but he pointed out two improprieties respecting the grooms or guards. He thought that, even in that rude age, they would not have slept in the regal chamber; but would, as a matter of safety, have been placed in the anteroom, and might have been represented through an open door. I think, so far as recollection serves me, that he thought highly of their execution, but that they were brought too forward for subordinate subjects; and that it was a capital error, obscuring any part of the principal figure by them: one of the feet and part of its leg were so obscured; neither did he like the Lady Macbeth listening. He thought many parts of the "Solomon" very fine, and the heads of the two Rabbis "equal to anything in the Venetian school." That Haydon should not have availed himself of the natural ornament of hair, surprised him much. "It was so essential to female beauty," he said, "that he never could imagine a nun to be beautiful." I said something which he thought slighting of Mr. Northcote's picture of "Solomon." He reproved me immediately; spoke highly of the picture, and highly of Mr. Northcote, as I have often heard him do. Mrs. Fuseli was particularly partial to Northcote. Fuseli could convert anything into an occasion of improvement. One very foggy day, it was impossible to do anything in the council-room. I gave up long before he did. When he had moved the position of every shutter in vain, he turned to me with a strange mixture of vexation and humour in his face,—"I wonder what the Persian ambassador thinks of our sunshine!" Then making me look towards the darkest corner of the room, where the door leading to the Academy was not even discernible, he desired me to notice that, obscure as all was, I should still have no doubt, if I were standing there for the first time, that the whole end of the room was of one colour, and at one distance. That shade never could bestow a colour different from the real one of the object; and followed up the observation by what was, in truth, a lecture upon the depth and transparency of shade; and what to observe and what to avoid in endeavouring to produce it upon canvas. "Always remember, if you wish to represent darkness and distance, that if you begin by painting dark you will defeat your own object." I used the term "shadowed." "Don't say shadowed, it is incorrect." "Shaded, then, sir?" "Yes. I know Sir Joshua uses 'shadowed;' but it is not right. You may be in the shade, but you can't be in the shadow of a body. I sit in the shade, and I make a shadow."

You [Allan Cunningham] think that Fuseli had not the art of gaining affection; and I think that he was master of it, and that, without ever losing respect. For myself, I know that the superiority was always felt, but the inferiority was never painful. There were no sneers at learned ladies, and no contempt for involuntary ignorance. I never felt so much awe and admiration for any human being; neither did I ever converse so freely with any one, or find any one's conversation so delightful. Perhaps my extreme ignorance of the world, and such reading as I had, made me more sensible of this pleasure, and might also to Mr. Fuseli render this frequent and familiar intercourse less troublesome and annoying than it might have been with individuals much more generally agreeable. A young lady, who led a life of gaiety and visiting, and whose reading consisted of the literature of the day, would not have enjoyed all that I did, and Mr. Fuseli could not so easily perhaps have gratified her tastes and his own. At first he could only have tolerated me; but we all in some degree like the objects of our kindness. I never professed gratitude or offered flattery. It is true that I was seldom inclined to think differently from him; some of my tastes and sentiments were naturally similar to his own; but exceptions did arise, and I was obstinate enough, when I disagreed, to prove that I was sincere when I agreed with him.

He never could bring me round to his opinion, that Miss O'Neill was as great an actress as Kean was an actor. I thought she was deficient in power of countenance, and that in *Isabella* she put herself in such a passion when her creditors came to her, that I wondered Villeroy did not run away. She was not, I thought, the Isabella that Southerne intended to draw; but Kean being the Richard and Othello that I had imagined, I had no doubt they were such as Shakspeare meant them to be. Fuseli always got my opinions from me, but he always closed the contest good-naturedly. He said, in this instance, that perhaps he took a more lively interest in Miss O'Neill because she was a female; and perhaps I might criticise her more severely on that account.

I was called by some an odd young woman. Fuseli, however, never gave any indications of such an opinion, and it was among my early sources of gratitude to him that he did not. And though the superiority of his intellect over mine was infinitely greater than that of any other person with whom I was acquainted; still there were subjects familiar to my mind which naturally came forward in conversation, from the subjects upon which he was so frequently employed. I was familiar with the Pagan mythology, Pope's translation of the "Iliad," Dryden's "Virgil," and Shakspeare, and was acquainted with Grecian history, Milton, and Cowper. I so little cared for the "Odyssey," that I never read it but once; my unconquerable dislike to Ulysses rendered me blind to the beauties of Homer, and deaf to the arguments of Fuseli. Whether Fuseli really very much admired Ulysses or not, I never felt sure; but a painting of his, addressing the ghost of Ajax, often brought the subject forward, and I luxuriated in the glare of Ajax's eye, and the fixed determination of his step. Had you listened to the playful good-nature with which Fuseli would carry on a dispute of this kind, you would think that affection could not easily be denied him. "Oh, you have been deceiving me all this time. I thought you were a Grecian, but you are a Trojan. It's the wooden horse you can't swallow." Then all the things without which Troy could not have been taken, and which Ulysses had procured; and at last,—"Well, I am sorry he is not in your good graces; but I must paint him, for all that."

There were characters of Homer's which Fuseli seemed to wonder at anybody painting, and which he said he never felt that *he* could paint. Achilles and Andromache were of the number. Every one, he said, who had read and felt Homer had a personification of those characters in his mind; and which, as no others might resemble, no others could embody. He was not afraid of the gods and goddesses; and many of these had prescribed forms and features as well as costumes and characteristics. I had seen the sketch for the "Hercules assailing Pluto," but when I saw the picture shortly after

* See p. 4, *ante*.

† At Covent Garden Theatre in the season of 1810-11.

its commencement, I was confounded at the majesty of Pluto, and told Fuseli that I had never conceived him to be half so handsome, and that I should rather have taken him for Jupiter. "Well, and he is the brother of Jupiter, and a god; and the Jupiter of Hell; and Hell, you know, is not merely Tartarus. I am sure you know better than to wish me to paint him black, with horns and a tail. When Jupiter is present, Pluto and Neptune must be represented as inferior to him; but when he is absent you may make them as handsome as you like, or rather as you can. Here he is a king upon his throne, and he must not show fear; he must only express astonishment and indignation at the daring presumption of a mortal. Proserpine may show fear, but not enough to take away dignity. Her attendant, may very properly be more frightened."

"And, upon what occasion, sir, did Hercules assail Pluto? I don't remember anything about it." "It is contained in only three lines in Homer, and the occasion is not mentioned. Dione, in comforting Venus, who complains to her of being wounded by Diomedes (Diomedes, you know, is one of your favourites. How comes that? He was a great friend of Ulysses, and helped him to get the horses of Rhesus!), tells her that her misfortune is not unprecedented, even Hell's dread king having been so severely wounded by Hercules as to flee to earth to be cured."

I write entirely from memory; for, since that time, I have enjoyed no advantages of books, society, or leisure, calculated to keep up any little acquaintance with such subjects, which I then possessed. I think, however, that I am correct; but, if in names, or any other matter, I am not so; the fault rests with me, and not with Mr. Fuseli.

I give you all these particulars, because they show a patience and accessibility very rarely to be met with. Fuseli, no doubt, expected that this picture was to tell its own tale, to all competent judges; yet, he indulged by explanation my ignorance and inexperience. He once gave me a severe, but important lesson. I told him something I had heard; he turned round in violent anger,—"It's a lie,—a d—d lie! and you told me a lie the last time you were here! Where do you pick up all these lies?" I could only say that I did not know I had told him any lies. "Yes, you did. You told me that Haydon had sold his 'Macbeth' to Lord Mulgrave for six hundred guineas; and I congratulated him. And it was a lie." "Well, sir, I am very sorry to hear it—especially on Mr. Haydon's account; but, if it is a lie, I did not make it." "I know you did not make it. I know you would not make it. But you must be more careful in repeating what you hear. You may do as much harm by repeating the lies of other people, as inventing them yourself."

Fuseli began one morning to alter the drapery of Pluto, much to my regret, and by no means to his own satisfaction. The space it occupied on the canvas was immense, and the quantity of colour he expended very great. He stamped, swore,—called himself an ass,—a fool,—and a blockhead,—while the rapidity with which he almost flew up and down from his frail perch terrified me exceedingly. Its construction was two large tables placed beside each other, with a chair, and a small flight of steps upon them,—and he used either as he found it convenient. As he never liked the confinement of his palette on his thumb,—for he used the brush with equal facility in either hand, and in his own room it lay upon a table,—here, that he might reach it when on the top step, he had put three of the small boxes or stools from the Academy in a pile, and still he had to stoop greatly to take up his colour. (He did come down one day when I was present, with the whole of these articles, but was happily not hurt.) I durst not speak, for I had objected to the alteration, and he bestowed upon me from time to time some grim smiles. At length he flew out of the room, making the opening of every door be well heard, and returned with a very excellent shirt, which he unfolded very deliberately, took a survey of, and then tore into large pieces. By using nearly the whole of this, and the aid of turpentine, he scrubbed out his whole day's work. I ventured then to join him as he was contemplating the picture, and to say I was glad that he had restored it. "It will come out yet," said he; "Mr. West is a happier man than I am; he can sit all day with his man standing him what he wants, satisfied with what he has done as soon as he has put it in; while I go backward and forward, studying and altering my work, and can't please myself at last. People may say what they like of my faults. I know my own faults better than anybody else does; but I can't mend them: I wish I could."

"But, after all, sir, you would not change minds with Mr. West?"

"I would not change minds with any one. I would not change minds with Raffaelle if he were living; though I know very well that I never did and never shall paint as well as he did. I paint as well as I can. Nobody would choose to give up his own mind, his own identity." Of the pictures which I saw him paint, I think one of his own greatest favourites was the "Wife of Sarpedon awaking and discovering the dead Body of her Husband." He had the canvas enlarged twice. The Romeo, in a picture where the spectator was supposed to be in the balcony with Juliet, caused him great trouble. "D—n that little fellow," he cried, "he will look like Tom Thumb!" Fuseli could look as fierce and speak as loud as any one; but he could also smile as benevolently and speak as gently.

"You know nothing of accumulation, do you?" was Fuseli's abrupt inquiry of me at the Academy. "You don't know that money begets money?" "Not very well, perhaps, sir," was my reply. "You don't know it at all," he continued, hastily, "and you will never be married, Miss Patrickson!" "Why not, sir?" "Because you don't take the way; and you never will. Your mind is already pre-occupied. It is filled with other things. You don't invite the attention of men, by paying attention to them; and if you don't make men of consequence, they will never make you so. If you don't care for men, they will never care for you. Never! never! So you will never be married while you live."

I don't know from what he judged of me, for I think he had no opportunities of observing my conduct.

He had but few people who called upon him, and did not always admit them. I thought he liked best to see Marchant* and Flaxman. He was vexed sometimes with the too ready goodnature of the latter; and thought that he did not sufficiently preserve his dignity in the council, but, when books and papers were wanted, would run and bring them. I liked to see both these gentlemen, for they would look at what I was doing and speak to me.

I don't think Sir Thomas Lawrence has been happy in his portrait of Fuseli;† the miniature painted by Moses Haughton is much more so; it was engraved by himself, and painted, I think, for the Countess of Guildford. . . . . .

You mention the spelling of Fuseli's name,—the dedication in Lavater's book was headed simply, and I think beautifully, "To my friend Henry Fuesslin, in London." I remember from other circumstances, that it was in the spring of 1815 that he named his age to me. It was the only occasion upon which I am aware I ever said anything to him like a compliment; but I was taken by surprise, and could not check the expression of my feelings. I was ill, and going to the country. Fuseli was unusually grave. "You are going to the country for your health! I sincerely hope you will find benefit." I said something expressive of good wishes for his, when he replied that he could expect little change but the last. "Are you ill, sir?" I cried, alarmed. "Ill! I am seventy-one. Is not that enough?" "But what is seventy-one, sir? Michelangelo lived to ninety, and why should not you?" He smiled kindly, and said, "So you think I might live as long as Michelangelo, do you?" "I wish, sir, that you may live as long as your faculties are unimpaired, and as you enjoy life; and I know of no reason for supposing that Michelangelo at seventy-one was superior to you in those respects." "You are very kind, and I am much obliged to you; but I am not Michelangelo." "But you are more like him than anybody else, sir."

Sir Joshua Reynolds's description of Michelangelo's colouring, and his approbation of it, as in consonance with the grand style, had given me this idea before I knew Mr. Fuseli; and they were identified together in my mind: I don't think from his manner he had ever any idea of it before. It is likely,—as you mention it was an idea he was fond of himself,—that Mr. Haughton might have contributed to my impression. I learned with great regret, some years ago, from a Miss Fowke, that he had quitted Somerset House, and not upon good terms with the keeper. The same lady told me, and on his authority, that Fuseli was unrivalled as an entomologist; and so indefatigable, that he would rise at four o'clock and walk several miles to watch the operations of spiders on a hedge.

If Fuseli showed no contempt for involuntary ignorance, as little did he show toleration for the indolence or inattention which neglected to call into exercise knowledge already possessed. If I asked him the subject of a picture, and he thought I really did not know it, he would generally tell me very fully. Two or three times he has said: "It is a story that you do not know, and which it is not necessary you should know." But, if he was painting from an author with which he knew me to be well acquainted, he was very angry. I sometimes asked him when I thought I knew, but was afraid if I was wrong that he might think I wished to appear to know more than I really did; but I once made an inquiry so inconceivably stupid, that I am ashamed to relate it. The subject was "Macbeth questioning the Armed Head." He answered in a tone not of loud, but of serious displeasure. "I shall not tell you. You knew when you asked; or, if you did not, you ought to have known. What do you read for? what do you paint for? what do you come to me for, if it is not to increase your knowledge? You have some knowledge—why don't you make use of it? Would you go in leading-strings all your life? When you ask me anything you don't know, I am happy to tell you, if it is right for you to know; but when you ask me what you know already, you give me unnecessary trouble; and you ought to give no one unnecessary trouble."

You* will long since have thought that I shall never have done; but I can accomplish my purpose no other way. It took the mouse a long time, and many a nibble, to free the lion. Like her I must use the means I have; and the object is thus far suited to them, that it is not an important benefit conferred in a single art, but a long-continued series of kindnesses, which could only arise from benevolence, in a man so quick in temper, so tenacious of his time, and so impatient of intrusion, towards one who had no claim upon him, whose family he did not know, and whom he never saw herself beyond the walls of Somerset House. And, setting aside painting, if my mind and principles were not benefited, the fault must rest with my negligence or incapacity.

When I consider all that I remember, I cannot help regretting the much more that I have probably lost, partly from the inevitable lapses of even the best memory, and mine is a retentive one; and still more from the certainty I feel that I must have been incompetent to be conscious always of all the good within my reach. Dawe† said well, that I should never know the extent of my obligations. How patiently he endeavoured to cure me of anything childish or silly! I had always a steady hand, and a mall-stick was an incumbrance to me. Some of the students in the Gallery thought that I did not look like an artist without. I asked Fuseli if it was necessary to use one. He said he did not know what I meant; I was the best judge. All these helps were good when they assisted, and should be rejected when they did not. I told him I had tried to use one, but it was always in my way, and sometimes in that of other people. "And why were you such a fool? Can't you judge for yourself? Keep a mall-stick by you, and everything else that may be necessary: use them when they are so, and never at any other time. Never mind what people say to you, unless you find it to your advantage." Often after I had left his study I used to linger in the largest of the three rooms leading to it. He sometimes, but not often,—for I always made my escape if I heard him,—found me there, and it was generally before the same pictures. Of one particular favourite, "Christ the instant before his Disappearance from his Disciples at Emmaus," he promised to give me his original sketch; and often he looked for it, as well as for a second edition of his Lectures (then out of print), which he likewise promised me; and much I saw in these researches, and much came to light that Fuseli had not seen for long; but not the Lectures, nor the sketch; and I am sure they never did; for he promised, before I came away, to

* Nathaniel Marchant, sculptor, elected a Royal Academician in 1809.

† The head engraved for Mr. Cunningham's "Life of Fuseli."

* Allan Cunningham.

† George Dawe, Esq., R.A.

keep them for me; and he never forgot what he promised.

Two things in your Life of him gave me pain; but I have no right to speak upon either, for I am utterly ignorant upon both. *You* don't seem *certain* of either; and I regret that they are there:—one, what you term his wife's original "vocation," of which I never heard the slightest hint, and which may lessen her in general estimation; and she is an excellent woman. The other, the probable cause of his leaving as much as he did. Mrs. Fuseli's personal expenses must have been moderate. I have always understood that their table was frugal, and that Mr. Haughton paid handsomely,—120*l.* per annum. But for these particulars I cannot vouch, any more than for Lord Rivers being a liberal purchaser of his works; but I have often heard it. I think, if Mr. Fuseli had really wanted money, he would have accepted it from liberal friends; and that, had circumstances been reversed, he would cheerfully have assisted others. But, if he did not require it, I cannot think that he would have failed to decline it. On my part, this is certainly mere opinion; but you will, I trust, excuse my giving it freely.

Looking over to-day, for the second time, your Life of Fuseli, I see that you have mentioned the piece of plate. Writing as I do, by snatches, with my mind much, but not agreeably occupied, I cannot methodize, and trust you will excuse it. Another word of Fuseli: he had no little tricks, no petty concealments; his process of colouring, his method of producing his tints were all at your service; and his doubts of himself were equally candidly expressed. "What do you think that is?" he said once, pointing to a part of his picture. "Blood, I think, sir; but I don't know where it comes from." "Well, that is right; I mean it for blood; but I am not exactly sure about its appearance. I should not like them to think it was drapery; and that the man was frightened at an old red cloak." I see, on looking over what I have written, that I have given the foreign peculiarities of Fuseli's pronunciation. I had no intention of doing so; but seeming to see and hear him, it came naturally and irresistibly.

Make any use of this letter you please, except destroying it: I may wish for it again myself. It is the only record I have ever made of my best friend and benefactor, and I have conceived a value for it. I have never, since I left London, seen any picture which impressed me with such deep, engrossing admiration as Fuseli's did, excepting Danby's "Upas Tree."

I have not yet succeeded in getting a sight of your first volume; and I am most anxious to do so because I hope to find the Life of Owen; not merely because I was a great admirer of his colouring, and that he was very kind in giving me information in the British Gallery, but that I heard much of his love of his art, and contrivances for painting during the latter period of his life. One of my best friends in the Gallery was Mr. Jackson, always goodnatured and ready to assist the inexperienced, either by precept or taking the brush himself. But I am always best pleased to hear of Mr. Northcote's being well. I never knew him, and was only in his company twice. I liked his manners, they were very kind and encouraging.

And now, sir, that I say I will release you; I wish you not altogether to think it a release, for I would willingly have you as interested in Henry Fuseli as is his grateful pupil, who is, sir,

Yours, very truly.

MARGARET PATRICKSON.

Allan Cunningham, Esq.

I conclude Miss Patrickson's to me very agreeable paper with an early notice of Fuseli overlooked by the biographers of the painter. In the "Miscellanies" of John Armstrong, author of that fine didactic poem "The Art of Preserving Health," the reader will see, at vol. ii. p. 236, the following passage:—"*Even this barren age has produced a genius, not indeed of British growth; unpatronized, and at present almost unknown; who may live to astonish, to terrify, and delight all Europe.* But true genius is such an uncommon production of nature, and is so much superior to all quackish arts of recommending itself, that when it does appear, it is no wonder that a generation of people without taste do not know it."

The "unknown genius" of the year 1770 was Henry Fuseli, a name of note in the history of English art rather by what he might have done than by what he did.

PETER CUNNINGHAM.

THE NEW "SOUTHWARK STREET."

ON the 1st inst., the Board of Works opened to the public the last portion of the new street which has been formed by them, leading from opposite the end of Stamford-street, in the Blackfriars-road, to High-street, Southwark, not far from London Bridge. The street is 70 feet wide from front to front of houses, and will be recognized as a very important improvement. It is to be regretted that it is not straight. In conjunction with Stamford-street it forms the double curve known as the "line of beauty,"—a line by no means desirable in thoroughfares, if we would have the public make use of them. An Englishman has an unconquerable aversion to a "round," though fully aware from his own experience in stoppages, that very often "the farthest way round is the nearest way there." Doubtless, however, there were cogent reasons for adopting the present line. Even the Board of Works cannot do what cannot be done.

A memorandum given by the Superintending Architect affords some particulars that are interesting. The Board obtained their Act for the street on the 10th of August, 1857; the first notices to treat were served in April, 1858; and the Streets Committee commenced their negociations for acquiring the property at Midsummer, 1858. On the 1st of October, 1861, the first contract for the formation of the street was taken by Mr. Downs, of Union-street, Southwark, who constructed the part from High-street, Borough, to Great Guildford-street (including the main sewer, vaults, subway, and pipe-connexions), the portion from High-street, Borough, to Southwark Bridge-road, being opened for public traffic in July 1862, and that to Great Guildford-street at the end of that year. On the 31st of March, 1863, the second contract for the construction of the street, from Great Guildford-street to Blackfriars-road, was let to Mr. Thomas Pearson, of Kennington-cross, who has now completed it, as far as regards the construction of the sewer, subway, roadway, and vaults, and it was this portion that the Board opened on the 1st inst. The operations, it is stated, have been greatly retarded by two or three serious cases of compensation, which it was necessary to contest in the Courts of Law.

The total length of the street is 3,450 feet, or about two-thirds of a mile. About 400 houses have been pulled down for the formation of the street, and the vacant building-ground on each side consists of about 200 separate plots, seventeen of which have been already let. At the south-eastern corner of the Borough end of the street, several plots have been let to the Alliance Bank of London and Liverpool, who have just erected their offices; and plots have been let to hop-merchants and others, so that the vacant land at this end of the street is being rapidly covered. Several plots about the middle of the street, too, have been let, and the Board anticipate that as soon as the advantages of the thoroughfare have been felt, the vacant land which they have now to dispose of will be speedily taken.

The cost has been immense, though probably it ultimately will not be quite so large as was originally estimated, larger returns being expected from the land than were at first anticipated. The estimated cost stood thus:—Purchase of property, goodwills, &c., 464,137*l.*; 10 per cent. for contingencies, 46,412*l.*; sewer, paving, &c., 8,875*l.* — total, 519,424*l.* The actual expenditure has been, for first item, 480,012*l.*; the second, 27,936*l.* professional, law, and other charges; and the third, Mr. Down's contract, 24,153*l.* expended in subway, sewer, paving, and vaults for cellars, instead of a sewer, and paving only. The cost of the cellars is to be repaid by the persons taking the building frontage; and Mr. Pearson's contract, 24,950*l.*, making a total of 557,051*l.*; or an excess of actual over estimated expenditure, caused by the formation of subway, not originally contemplated, and building of vaults, amounting to 37,627*l.* The receipts, partly realized and partly estimated, are now put at 267,031*l.*; leaving the actual cost of the new opening, 3,450 feet in length, 290,020*l.*

It will serve as an answer to more than one correspondent if we mention here that the Metropolitan Board of Works are bound to sell within a given period the rents obtained for land which comes into their possession in making improvements.

The subway, a capital specimen of brick-work creditable to all concerned, if we may judge from the face of it, is precisely similar to that in the new street leading to Covent Garden, of which an engraved illustration will be found in our volume for 1860 (p. 640), together with estimates of cost. The subway itself contains the gas and water mains, and there are side arched passage-ways for the service-pipes to the houses. Below the subway is the main sewer. Belief has been expressed that the escape of gas from the pipes in the subway will lead to accidents, not to be avoided by the best ventilation attainable. Even should this prove to be the case, it must not be viewed as an argument against the provision of subways, but a reason for the use of gas-pipes and joints capable of preventing leakage.

THE NATIONAL SHAKSPEARE MEMORIAL.

THE arrangements proceed very slowly; so slowly, indeed, that unless a move be made forthwith they will not be sufficiently perfected by the 23rd of April. A magnificent committee has been formed; strong enough even now to carry the project to a most successful issue if the proper course be adopted. There are, however, in it too many who think they have a right to lead, with a few elements of discord, and unless some give way, —unless 380 of the 400 members of the general committee will, sensibly, subside into "subscribers," and depute the remaining twenty to do the work for them, constant collision of opinion must result, delay is inevitable, and failure after all not impossible. The course is now so simple and straightforward, if taken *immediately*, that nothing but dismion and bad management is to be feared. The proposed public meeting should be held as soon as possible, let who will take the chair: certainly not later than the last week of the present month. An immediate appeal should be made to the country for subscriptions, not waiting, under the circumstances, even for the public meeting. By the end of February an idea must be arrived at of the probable amount of money forthcoming, and steps must be taken to obtain a design founded on that probable sum, in the following six weeks: a ridiculously short time for the work; but no more is left. Meanwhile, the best possible site must be obtained; not an easy matter. We would suggest, without now going into particulars, a portion of the Green Park, adjoining Piccadilly, as eminently well adapted for it. There the monument would be seen by all without looking for it, and it would lend itself well to the adornment of the metropolis.

An alternative plan contemplates the laying of the first stone of a monument in April, without determining the design; leaving that to be regulated by the amount of subscriptions a longer time might enable the committee to obtain. There would be a spice of absurdity, however, in this proceeding, which should be avoided if possible. Let there be no jealousies; no personal ambitions; but let all unite for the common object of raising a worthy evidence of the nation's homage. The great cry out of doors is, what description of monument do the committee contemplate?

A correspondent on the subject of the proposed memorial writes, — As the coming Shakspeare celebration more nearly approaches, the attention of the public is being more particularly directed to the subject, and it is satisfactory to find that the Urban Club and other bodies, who were rivals in a good cause, are now working with the central committee. There seems, however, to be a want of some express plan, and also of method in collecting the subscriptions. To do honour to Shakspeare, is a matter which concerns every one; it is therefore hoped that all classes will cheerfully contribute, and that on this occasion the working men will show their appreciation of our great poet. During the recent subscription for the relief of Lancashire distress, the sums contributed by the working-classes proved in the aggregate enormous; and in the instance of the Shakspeare Memorial, there is little doubt that if the matter were properly started, the same satisfactory results would be the consequence.

In our manufactories and workshops, a subscription of from 1d. to 6d. each man, would produce a considerable amount. In other ways there would be large funds forthcoming, provided the matter were properly set moving; and it is suggested, that with a view to this the working-classes should be represented in the committee

of management. With this exception the committee includes representative men of nearly every profession, grade, and opinion in Great Britain.

ENGINEERING SURVEYING.*

IT is a trite observation that a book, whether good, bad, or indifferent, is always more or less a sign of its time. A man cannot well write a book without some consultation with and inquiry of other men; he must get a publisher to undertake it; he must correct the proofs and review his own work before it makes an appearance in public. It is indeed but seldom that a book may be looked upon as an expression of the opinions of one man alone. The two works, the titles of which we have given below, are in themselves distinct expressions of opinion that the standard of scientific education amongst professional men—or would-be professional men—in England, is exceedingly low; at any rate, as compared with the scientific professional preparation of the Continent generally, and more especially of Germany. Mr. Merrett's work in particular sets out with the assumption, that it will meet with a circle of readers consisting of scarcely educated men. Not that his book is bad. By no means. It is remarkably well fitted for its intended purpose,—that of instructing a class of ill-prepared readers in the duties of land-surveying. But we can assure him that his note to Continental publishers,—"That the right of translation is reserved,"—is quite unnecessary. Mr. Merrett will never have to utter the old complaint—*Traduttori, traditori!* But how is it that the class in England devoted to what may be termed the technico-scientific professions should be—as a class—so behind their continental brethren? The question cannot be answered in a few sentences, and we have not space to enlarge upon it at present. But the fact is, that we have been inferior to France and Germany in an organized system of scientific education ever since the time of the first Napoleon. It is sixty years ago that the First Consul himself a first-class mathematician, and an excellent civil engineer, and aided by Monge, Lagrange, Laplace, De Prony, and others, organized the *Polytechnique*, the *Ecoles des Arts et Métiers*, and the other educational institutions destined to do the work intended to be done by such books as those now before us. The principal towns of the Continent speedily followed his example. Education, like the other good things of this earth, gets cheaper in proportion as it gets more common. A first-class scientific preparation for a technical profession can now be had for about 5*l.* per annum at Carlsruhe; at some of the other German Polytechnische Schulen for even less! Of course these establishments receive Government grants, and the students are subjected to a Government examination. We find Mr. Mark Friar, in the introduction to Mr. Hoskold's work, stating that "Men are employed as responsible managers [of collieries] who are totally ignorant of the most elementary principles of mechanics, the laws of gases, the principle of the safety-lamp, the geometry of figures formed by faults and heaves, and the theory and accurate practice of surveying and levelling. . . . . The speediest and most effective remedy that we can suggest is, that all responsible managers of mines be required by Government to obtain certificates of practical and theoretical competency for their situations before being allowed to enter upon them. Local Boards of Examiners could easily be established for this purpose; and it would be no difficult task so to combine the practical in examinations with the educational and scholastic, as to preclude the possibility of any mere theorist obtaining a certificate." What Mr. M. Friar says of mining engineering can be repeated of many other branches of the profession. It has been often remarked that doctors and lawyers have to be officially examined before they can legally handle the lives and property of their fellow-subjects; but that engineers, who deal with both life and property, can practise without any examination; that in the engineering profession the man of true science and the rule-of-thumb charlatan are both on the same level in the eyes of the unprofessional and necessarily undiscriminating public. The status of the engineer is now mainly determined by success in the world. We vote a man an engineer upon the same principle as we give a vote to a 10*l.* householder.

Mais revenons à nos moutons. We have said that Mr. Merrett's is an excellent popular work on surveying—in spite of its grammatical mistakes and of its illiterate style. But Mr. Merrett seems to fancy that common logarithmic tables are as scarce as before the days of Briggs; and that excellent treatises on arithmetic and geometry are not to be bought for a few pence at the first best old-book stall. More than one-third of the book is devoted to the most elementary parts of arithmetic and geometry. This portion of the work is evidently too short for those who are expected to take up surveying before being taught the first elements of science; while it is evidently in the way of more educated students. Mr. Merrett advises his uneducated readers to spend their leisure hours with the best authors on mathematics; but we cannot see any sign that he himself has really gone through a mathematical curriculum. Seventy pages are next devoted to an excellent practical treatise on land-surveying; forty to levelling; twenty to calculating quantities; and some forty pages to a description of most of the instruments used in surveying and plotting, and of their several uses. This last part is the best portion of the book. On the whole, we may say that the work is good of its kind, but that its kind is not good.

Mr. Hoskold's work is of a decidedly superior class, but the common vice of book-making is also here prominent. Fifty pages are given to the ordinary trigonometrical tables of sines, &c., and to an introduction to these tables in which our old friends "the Arabians" figure with their usual persistency—rivalling Lord Macaulay's irrepressible "New Zealander." Another portion of nearly fifty pages is given to such elementary subjects as practical geometry, practical plane trigonometry, and the nature and use of logarithms. Not much less than one-half of the book is thus filled up. The work is substantially a treatise on mining surveying; the book by no means encompasses its pompous title of "Land and Railway Surveying, Engineering," &c. The chapters devoted to land surveying in connexion with underground work, and to setting out railways to mines, are the best and the most original parts of the book. We have no doubt that the great extension of underground railways will cause this work to meet with a ready sale.

Cynics often observe that the greater part of the "scientific" works,—from the elaborate quartos, in all the dignity of large print and steel engravings, to the more humble pamphlets on new inventions with which we are perennially inundated; that the majority of the "scientific" papers read at all times and seasons before the multitudinous mutual admiration societies of the metropolis, are not always published from honest promptings of having really something to write or to say on a scientific question. Too often are these printed or *viva voce* demonstrations but refined puffs, either of the men themselves, or of their personal friends, or of their businesses, or of their patented inventions. We will not go so far as to say that the books we have just examined are intended to give a puff to a purchaser seeking bread. But we cannot help noticing that neither of our authors has forgotten to have an eye to business. The most prominent object in Mr. Hoskold's work is "Hoskold's Miner's Transit Theodolite," "manufactured only by John Archbutt & Sons," &c. &c. Mr. Merrett has not forgotten "Merrett's patent improved quadrant" and "Merrett's patent improved scale." A neat little advertisement at the end of the book gives us Mr. Merrett's address, and informs his more obtuse readers that he is ready to help them, "on moderate terms," out of any little difficulty. Should a more venturous student undertake some surveying work, and fail in the attempt, he is told that Mr. Merrett, again, executes "professional works of any description with neatness, accuracy, and despatch." A perusal of this little circular will show that its style and grammar are rather questionable—as to its meaning and good taste there can be no question. Whether this sharp eye to business is calculated to raise the general status of the profession is another inquiry that our readers can answer for themselves.

* "A Practical Treatise on the Science of Land and Engineering Surveying, Levelling, Estimating Quantities, &c. With a General Description of the several Instruments required for Surveying, Levelling, Plotting, &c., with Illustrations." By H. S. Merrett, Architectural and Engineering Surveyor. London: E. & F. W. Spon, 16, Bucklersbury. 1863.

"A Practical Treatise on Mining, Land and Railway Surveying, Engineering, &c. Containing the Errors of the Magnetic Needle; Practical Geometry and Trigonometry; with Description, Use, and Adjustments of the Miners' New Transit Theodolite; also, a new Plan of Setting out Underground Railway Curves; Underground Levelling; Construction of Longitudinal, Transverse, and Geological Sections of Mines, &c. With Tables of Distances from Planes of the Meridian and Latitude, Tables of Natural Sines, Secants, Tangents, Ratios of Inclined Planes, &c. Illustrated by numerous plates and woodcuts." By H. D. Hoskold, Mining Engineer and Surveyor. London: Atchley & Co.

LANDOWNERS, COMPANIES, AND SURVEYORS.

A FEW days ago the *Times* printed a letter, signed "A Sufferer," asserting that surveyors who were employed by owners of property to make claims and support them against railway companies requiring the property, sacrificed their employers in order that they might not offend a company. The writer said,—

"It is perfectly well known that, if a surveyor venture to claim the full value for property taken by a railway company, he not only incurs the enmity of that company, but is virtually placed under a ban by others, and may for the future look elsewhere than to them for patronage and support.

When, then, on the one side are ranged the railway companies, with an enormous amount of business to bestow or to withhold, and on the other stands the unfortunate claimant, with little or none at his disposal, it is not difficult to divine which party is the more likely to carry the day.

In fact, it becomes the interest of the very surveyors employed by the owner for the establishment of his claim to depreciate his property to the greatest possible extent. The claim made by them in his behalf is still further cut down by the surveyors retained by the company; and if the matter go to arbitration (the course, for some reason, always advocated by the claimant's agents), the amount of compensation is decided by another surveyor, and the owner may consider himself very lucky if he obtain half the marketable value of his property, receiving nothing for compulsory sale and the damage done to surrounding land or buildings.

Now, without saying that surveyors are worse than their fellow-men, it is not to be supposed that they are one whit better; and we all know, when men, who are totally irresponsible are exposed to the fear of injury or the temptation of gain, even when the two are not (as in these cases) united, what the probable result of such a combination of circumstances will be. Now, I do fearlessly say that an immense amount of injustice is daily and hourly committed; that this injustice is to be traced to the land-agents and surveyors; and that these land-agents and surveyors are totally irresponsible."

The impulse on the part of any who has had large experience in such cases is to deny the accuracy of both statements. There are plenty of able surveyors who when employed think only of their clients' interests (some, indeed, ready to support very extravagant claims), and they are *responsible* for culpable negligence in the discharge of their duties, as any other agent would be.

While we unhesitatingly say this, we are forced to agree with one inference from "A Sufferer's" letter, namely, that matters are not as they should be in respect of the settlement of claims for property taken under Acts of Parliament; and the tone of a number of letters which have been written to the *Times* since the appearance of the first, and of other, which, on different occasions, have reached ourselves, serves to show that this opinion is widely spread. Quotations from a few on both sides will serve to bring the matter before our readers. The first, "Surveyor," who replies to "A Sufferer," says,—

"Is 'A Sufferer' quite sure that the surveyor and not the claimant is always at fault? Are not claimants sometimes disposed to ask more than their property is worth? May not this account for the surveyor advising the claimant to be more moderate in his demands? And is the surveyor fairly open to the very serious imputations cast upon him by 'A Sufferer'? Should I be thought uncharitable if I reminded 'A Sufferer' that juries, and not arbitrators only, sometimes awarded a moiety,—a third, a fourth, a fifth even,—of the amount claimed?

My conviction is, that the members of my profession, as a rule, are too willing to lend their influence in support of unjust claims against the railway companies, and that they would do claimants more substantial service if they were to seek at the outset to put their clients right on the question of value, and not only so, but positively refuse to support what in their conscience they know to be unjust and sometimes grossly absurd claims against the companies.

I confess, with shame, that the profession is being brought into disrepute by the time-serving propensities of some in its ranks.

There is one gentleman, for instance, who is sufficiently accommodating to state on his oath, when giving evidence for a railway company, that a certain class of property is worth only sixteen years purchase; whereas, if he is giving evidence for a claimant, he will maintain on oath that it is worth twenty-four years'. The truth would probably be, as it so frequently is, midway between the two extremes."

"A Landowner" replying, asserts that,—

"Of late years there has been a disposition to cut down to the lowest possible point the claims of landowners; and, in my belief this has been brought about, as 'A Sufferer' contends, by the necessary connexion of almost every respectable surveyor with one or more of those companies which, in all disputes with landowners, constitute the more powerful and, for the nonce, the more popular side of the question at issue. Whoever doubts this may satisfy himself by referring to the report of, and the evidence

given before the Lords Committee in 1845, and comparing the cases of that day with the scale of compensation that is now given, e.g., 50 per cent was the rate at which compulsory sale was assessed by that Committee, and I believe I am right in saying that 25 is the very highest figure that is awarded now, and frequently not more than 20 per cent."

A surveyor to a railway company then comes in with,—

"From the long experience I have had in connexion with the subject, I am fully justified in saying that no claims are ever made below the marketable value of the properties which they relate, but, unfortunately, many are made highly beyond it. Nor are these after always made by the surveyors of the claimants themselves. Never, nevertheless, let your correspondent take courage, and when next he has a case of disputed compensation, let him write to me, and I will, without charge, give him a list of surveyors, who will go very far—perhaps not quite so far as he may wish, but very nearly so—towards that marketable value which his property possesses in his own ideas. Upon that list I promise him shall be the name of a surveyor who claimed of me more than 1,000*l.* for the leasehold interest in a house held for an unexpired term of two and a half years at 30*l.* a year, an Irish perch for the whole term at 5*l.* a year. I will also add the name of another gentleman who claimed for the interest of a yearly tenant, under a six months' notice to quit, in respect of one perch of garden land, upwards of 400*l.* But I submit that the reason alleged by 'A Sufferer' for his imaginary grievance is as erroneous as the grievance itself. If a surveyor of good position and experience is known to entertain a high opinion of any particular class of property which a railway company has to purchase, the company are more likely to retain him on their side to prevent the claimant from having the benefit of his evidence than they are to withhold him from employment because his estimates are high. The fact is, that the best men are employed indiscriminately on both sides, and they usually accept the retainer which is first offered to them."

Another "Surveyor" asserts truly, that by the Lands Clauses Act of 1845, companies are enabled and of late have been accustomed to treat unfortunate owners and occupiers in the most iniquitous way. The Act above referred to, under which all cases of compensation are settled, lays down express directions for procedure by a jury or by arbitration. But the 85th section of the Act enables companies, without making any agreement with owners of property, to go before a justice (giving no notice whatever) and get him to appoint a surveyor (generally of their own nomination), who, [illegible] act without any inquiry into the circumstances, fixes some sum, for which the company gives a bond, and forthwith enters into possession of any premises required. The owner has of course a claim against the company, but they keep him at bay; he is under every disadvantage in supporting his claim, and pending the settlement is put to great straits. He urges that a claimant should be entitled to a special jury, and goes on to speak of arbitrators,—

"If John Jones have a claim against a railway company, they must feel that while John Jones may never have another opportunity to employ them, railway companies can employ them all the year round. It is generally supposed that arbitrators' decisions have of late been nearly always unfavourable to claimants, by the Act referred to, the appointment of an umpire has, in case of dispute, with the Board of Trade, and up to within the last two years the Board appointed nearly always one gentleman, who resolutely declined to be concerned either for companies or for claimants, and so he might be considered an impartial judge; but this did not suit the companies, and so a great strain was put on the Board of Trade, when it appointed as a rule one of four gentlemen, all 'highly respectable men.' But still men who are largely employed by companies."

Another "Surveyor" maintains that the railway companies do work in concert, and frequently act vindictively against any surveyor who does his duty. There are, nevertheless, it is to be hoped, men of standing and independence to be found who are not to be awed or browbeaten; but a young rising surveyor has a hard struggle indeed should he incur the enmity of a company. He agrees it is a hardship that an owner is obliged to put a value upon his own land upon that which he is most unwilling to part with. A claimant has no other course but to ask enough, and then he is abused by counsel on the other side as a cheat and an extortioner. In France, the companies are obliged to make the first offer. If this is not accepted within a given time, the owner on his side must make a claim; and then if the parties cannot agree, and the matter goes to either a jury or arbitration, the costs are apportioned between the parties according to the award. Thus, if the claimant gets the whole of his claim, the company pay the whole of his costs, and *vice versâ*. If any intermediate sum is awarded, the costs are assessed to be paid *pro ratâ*. This seems to be a fair course, and to check alike exorbitant demands and niggardly offers.

In arbitrations, the method the companies pursue is this,—they narrow their list of umpires to as small a number as possible. Once give an award against a company, and you are no longer on their list. Having got a roll of what they call "safe men," what is the consequence? They will not agree to take any one who is not in their good books. The upshot is that the same umpire is in case after case, sees the same solicitors, and is addressed by the same counsel day after day. He knows he owes his position to the companies, and that in all probability he will never see or hear of the claimant again. It seems impossible that a man so placed, let him be ever so honourable, should escape from some bias. To prevent this the Legislature has provided a third method, which at first sight seems extremely fair to all parties. In case the parties could not agree on an umpire, a clause in the Act empowers the Board of Trade to appoint one *ex parte* to decide between them. Unfortunately, however, their list is even more restricted than that of the companies, and the persons appointed, though most honourable men, are liable to all the dangers of prepossession and bias alluded to above,—nay, as the number is more restricted, perhaps in a still greater degree. We have known some very unfair awards made by one of the number.

We agree with those who would compel the companies to make the first offer. This is no hardship on them, as they must have had all the separate properties valued for the purposes of their bill. We call upon the Board of Trade to enlarge the list of their umpires, and think it would be much fairer if they would not place in that list the name of any surveyor who is engaged in getting up cases, and going into the witness-box to support them.

It is nonsense to say that all surveyors are at times engaged as valuers by railway companies. For every one surveyor who has acted for a railway, a score may be found who have never done so. To state that surveyors, when acting as valuers for the public are "exposed to the fear of injury or the temptation of gain," is not worth replying to. Every company have a staff of surveyors to whom they always entrust their business, and their number being limited in proportion to the number of gentlemen practising as surveyors, the majority look to the public for support, and are totally independent of the companies. It is to the interest of each side to do their best for their clients, and the surveyor dependent on the public has every inducement to use his best energies, as an introduction to other business, irrespective of his charges being a per-centage on the amount of compensations awarded.

In London, a certain small number of gentlemen contrive to monopolize the great bulk of this description of business, appearing now on one side and then on the other, but, of course, more connected in consequence with the companies who remain, than with claimants, who change. How this may gradually have acted upon their notions of value we cannot say. Claimants have the remedy, to a certain extent, in their own hands. They should not run like a flock of sheep after one bell. Let them exercise discretion; take proper advice; and they will be able to find plenty of intelligent and competent surveyors, without bias or fear, ready to set forth and maintain just claims to the uttermost farthing.

ARCHÆOLOGIC ITEMS FROM ROME.

ON the 11th ult., the German Archæologic Institute met in their Library on the Tarpeian Rock, to open their session for the winter, and, at the same time, to unite with other objects, on this occasion, their customary celebration of the birthday of Winckelmann. To a large audience, among whom were some of the distinguished, were read two long papers by Dr. Henzen, the president, and Dr. Braun, the perpetual secretary, in which, besides other antiquarian intelligence, and general reports on the Institute's labours, were described, by Dr. Henzen, different monuments and epigraphs found in Umbria, referring to the Etruscan priesthood, and other public offices of that nationality. By Dr. Braun was given a learned criticism on a bronze bust lately found in some ruins of uncertain character, near Perugia, and now in the collection of a private proprietor in that city;—supposed, at first, from its delicacy and sweetness of expression, the head of a female; but, as the lecturer well argued, inferring from analogies with a classic statue at Madrid, really intended for Hypnos, the god of Sleep. A photograph of that statue was handed round, and on a table was exhibited a cast of the bust, enabling us to test the correctness of the lecturer's report, to admire the poetic character and fine melancholy distinguishing this head, which is, indeed, quite feminine in type, with braided hair parted in the midst, and two wings issuing laterally from the downcast forehead. Besides other photographs exhibited on the tables of the library, their subjects different antiques and portions of building lately brought to light on the Palatine or elsewhere in Rome, was handed round an interesting representation of a marble relief found at Porto (site of the ancient seaport at the Tiber's mouth, now a desolate and unfrequented spot) in excavations begun there last November, by Prince Torlonia. This sculpture has given rise to much comment, and contains a curiously complicated assemblage of figures (some evidently intended for colossal statues of gods), public buildings, ships, symbols: two galleys are seen approaching the mole of a seaport adorned by several splendid edifices. On one of these vessels is a colossal figure of Neptune among the human beings by whom it is manned; beyond are figures, apparently statues, of Bacchus, Ceres, Victory, a chariot drawn by elephants, with a female guiding them, the wolf suckling Romulus and Remus, a flowing altar, and (near the centre) a large eye. This mystic relief had been made the subject of an essay read by Visconti at the first meeting for the season of the Pontific Archæologic Academy, a week previously to the assemblage of the Germans; and that gentleman assumed it to be a *sacrum donativum*, one of those religious offerings made by the ancients as *ex viso*, under the influence of a dream—the spectacular representation, namely, of a particular scene supposed to be preternaturally spread to view, the subject here being the Port of the Tiber as enlarged and embellished by Trajan, with all its public monuments and statues of gods, the symbolic eye introduced as sign of the visionary character under which this splendid reality is here presented. The sculpture, regarded by the light of such interpretation, is almost unique among Classic records of Paganism in Rome.

At Ostia, the works of excavation were lately recommenced by order of the Pope, and are being continued at his private expense, liberally pledged for this object by Pius IX.; their most valuable result during this season being the discovery of a beautifully-executed mosaic, among the decorations of Thermæ, with figures of the Seasons, distinguished by their usual attributes and their names, *Ver*, *Æstas*, &c. At Prima Porta, site of the Vigentine villa of Livia, were also commenced early this winter the works, for a time suspended, for further laying open those ruins where the statue of Augustus (now in the Vatican) proved so inestimable a discovery; and a bust of his empress, lately brought to light, evinces the fact that art-treasures are not yet exhausted on that site. The works on the Palatine are progressing, nor have been interrupted since their commencement, in the Farnese estate purchased by the French Emperor; and here the most important detail in the imperial buildings, lately disencumbered of soil, is a remnant of the bridge thrown across the Forum by Caligula,—such, at least, is the theory as to this portion of ruin adopted by Signor Rosa, director of the Palatine excavations. On one of the vaults near the same spot an exquisitely-beautiful example of stucco relief, with floral designs and different figures divided by quadrate bordering, has been brought to light among recent discoveries,—this also in the section of the palace ascribed to Caligula, at the north-eastern angle, above the Forum.

In the course of restorations and improvements at a series of offices that form a wing of the Quirinal Palace, on the steep slope of the hill whence it takes its name, were lately reached, at a depth 40 palms below the street level, the remains of a massive structure, measuring 21 palms in height by 18 palms in width, with an archway spanning its front, and the epigraph above that detail: *Cn. Sempronius Cn. F. Romilia* (this probably the designation of a tribe) *Sempronia Cn. F. Soror Lucia M. F. Mater*,—assumed, in a notice given by the official *Gazette*, to be one of the sepulchres that flanked the Flaminian Way, and therefore external, as law enforced, to the limits of the city, marked by the more ancient walls—those, namely, of Servius Tullius. To this hypothesis we might object the height of the situation, just at the brow of the hill, where these ruins stand, far, indeed, above the level of the Flaminian, which passed under the Quirinal declivities.

On occasion of the Christmas solemnities at S. Maria Maggiore, two new features of rich deco-

ration attracted the public gaze in that superb basilica; the lately-completed "confessional," or elliptical chamber communicating with a crypt-chapel, and descended into by a double staircase, below the high altar, a veritable museum of precious marbles, the entire incrustation being of the richest kinds, oriental alabaster, amethyst alabaster, *rosso* and *verde antico*, *fior di persico*, *bianco e vero antico*, *breccatello*, &c.,—the design by the architect Vespignani, gracefully appropriate, and accordant with the character of this church; also a complete new set of altar furniture, in all the chapels as well as the principal sanctuary, consisting of forty-eight candelabra, and crucifixes in metal gilt, the donation of the Parizi and other noble families, and all wrought with much elegance of design and elaborate finish, at the establishment of Bellis, one of the first Roman goldsmiths. The restorations at the basilica of S. Lorenzo beyond the walls are actively progressing, and seem, so far as one can yet judge, in harmony with that ancient church's type of primitive Christian architecture.

The sarcophagi found, a few years ago, in sepulchres on the Latin Way, about two miles from Rome, and remarkable for their highly-finished reliefs of mythic subjects, bearing allusion to the destinies of the soul, have been restored and transferred from those tombs to the city, eventually to be placed in some museum. A late donation from the Pope to the library of the Archæologic Academy consisted of several artistic works, much valued; and another library has just been re-arranged, on better system, by desire of his Holiness,—the music archives, namely, at the Vatican,—a collection unique of its kind, comprising the MS. and printed compositions of all the great masters engaged for the Papal choir, from the latter half of the fifteenth century down to modern dates, the MS. codes in many instances adorned by exquisite illuminations and miniature paintings; the aggregate, however, diminished by the fatal spoliations suffered through the brutality of the troops who sacked Rome after the siege by Bourbon, and who *lit their fires*, in the Vatican chambers, with these and other volumes never to be replaced!

THE REMODELLED SCHOOL OF FINE ARTS IN PARIS.

THE Council for Instruction in connexion with the Imperial and Special School for Fine Arts, the formation of which was prescribed by the 7th article of the decree of the 13th November, 1863, has just been constituted by the Minister of the Emperor's household and of Fine Arts, as follows: The Duc de Morny, honorary president; the Superintendent of Fine Arts, president; the director of the administration of Fine Arts, vice-president; Messrs. Leon Cogniet, painter, member of the Institute; Muller, painter; Duret, sculptor, member of the Institute; Cavelier, sculptor; De Gisors, architect, member of the Institute; Lefuel, architect, member of the Institute; Forster, engraver, member of the Institute; Dumas, senator, member of the Institute; Mérimée, senator, member of the Institute; Noizer, General; Théophile Gautier, author.

The director is the immediate head of the staff of the school. He enjoys a salary of 320*l*. The professors for the courses receive an annual salary of 96*l*. The titles and privileges of the present professors and those who are superannuated are suppressed. The professors, chiefs of studios, independently of the localities which are conceded gratuitously to them for the installation of their studios, are remunerated by means of indemnities worth about 96*l*. a-year.

In connexion with the school a superior council is established, which is composed of a superintendent of fine arts, president; a director for the administration of fine arts, vice-president; two painters, two sculptors, two architects, one engraver, and five other members, named by the Minister.

The imperial and special school for fine arts is entirely devoted to the teaching of painting, sculpture, architecture, and engraving, in copper-plate, medals, and precious stones.

The following courses are given by the staff of the school:—1. History of art and æsthetics. 2. Anatomy. 3. Perspective. 4. Elementary mathematics. 5. Descriptive geometry. 6. Geology, elementary physics, and chemistry. 7. Administration and book-keeping, construction and application in work-yards. 8. History and archæology.

The daily exercises prescribed by the third article of the rule annexed to the ordinances of the 4th of August, 1819, are replaced by works executed by the students in the studios. For this purpose, attached to the school are three studios for painting, three studios for sculpture, three studios for architecture, one workshop for engraving copperplate, one workshop for engraving medals and precious stones. These workshops and studios are directed by artists who hold the title of professors, heads of studios, as has been stated.

The obligations are:—That all the pupils of the school attend the courses of history, æsthetics, and of archæology; that all the pupils who learn painting, sculpture, and engraving, attend the courses of anatomy and perspective; that all the pupils learning architecture attend all the courses except anatomy.

The competitions for the great Rome Prizes are open to the Imperial and Special School for Fine Arts. All artists, from the age of fifteen to twenty-five, whether pupils or not at the school, can compete for the great Rome Prizes, after having succeeded in two preliminary tests, on the condition that they are French.

One prize only will be awarded in each section.

For the future, the candidates who obtain the great prize in their section, and who are sent to Rome, will only receive pensions for four years. They are obliged to stay at home two years at least; for the other two years they may, if it is convenient, and they like to, devote them to instructive journeys, informing beforehand the superior adminstration of their intentions.

M. R. Fleury, member of the Institute, is nominated for five years Director of the Imperial School for Fine Arts.

SCHOOLS OF ART.

The Carlisle School The annual meeting of subscribers to this school has just been held in the Town Hall. The Mayor of Carlisle, who is president *ex officio*, took the chair. The secretary read the report of the committee, according to which, "during the first half of this year the attendance has not been so great as usual: this was owing to the illness of the late headmaster, Mr. Lord, who was at length obliged, through indisposition, to resign his situation. At the commencement of the present half-year, your committee succeeded in re-engaging the services of Mr. Lees as headmaster, and from their former experience of his capabilities as a teacher, have the utmost confidence that the school will soon resume its former numbers: indeed, at the present time, the number of students is almost as great as at any former period since the establishment of the school. At the annual examination of the works of the students, held in the school, by Mr. R. G. Wylde, in June last, thirteen medals were awarded; forty-eight candidates passed in the first grade examination, of whom fourteen received prizes; and twelve in the second grade, of whom six received prizes. These numbers are not so large as in the previous year, there being no master during the most important part of the half-year for the students.

The Southampton School.—At a public meeting held at the Hartley Institute, the Mayor distributed the prizes awarded by the Government Department of Art, and also those given by Mr. W. A. Rose, M.P. The Mayor said they had met there that evening for the eighth time to distribute the prizes, and he hoped that the advantages they could derive from this school would be more appreciated, that it would be more successful in future. Mr. Baker, the master, read the report. According to this document, the total number of students receiving art-instruction in direct connexion with the school during the current year was 1,017, the various classes at the school have been more regularly attended than in previous years, and as a consequence there had been a larger amount of successful work produced. The artisans, however, for whom the evening classes are specially formed, do not avail themselves of the advantages of the school to anything like the extent expected. The annual examination for the award of medals and prizes, by Mr. S. A. Hart, R.A., the inspector appointed by the Department of Art, took place in October. There were thirty-five works competing for medals, of which nineteen received awards of medals, and four others were marked by "honourable mention." Five of the best works, in certain stages, were selected by the inspector for the national competition for medallions, to be held in London next May. The inspector expressed himself perfectly satisfied with the display, and regretted that greater facilities could not be furnished to the more advanced students in the prosecution of their studies, particularly in reference to the light, which is quite unsuited for painting and drawing from casts, &c., in the day time.

The mayor afterwards distributed the prizes, and Colonel Sir Henry James and other gentlemen addressed the meeting. In course of his speech Sir Henry remarked, that to say that the study of art among the people of this country is a public advantage, was only to say that which is recognized by every one, for persons who had arrived to years of maturity could not but be struck with the tasteful manner in which the fabrics of dress for the daughters and wives of the present generation were got up, and how favourably they contrasted in an artistic point of view with the materials of forty or fifty years ago, with their coarse designs. Now one may walk through any of our principal streets, and see elegance of design, whether in textile fabrics, in gold, silver, or bronze, glass or china. The dresses of ladies of the present day were, as even a novice might see, distinguished not only by the beauty of their texture, but as well by the elegance of their design and colour. Nothing struck him more forcibly when in Scotland in the autumn than the report made on all sides of the wealth of that country, which had been developed indirectly by means of this extension of art study. Since the ports of France have been open to our produce, our manufacturers have been able to compete with the French in their own markets, not only as regard the elegance and fineness of texture of their woollen goods, but in the beautiful colouring and designs with which the fabrics are ornamented. Was not this, then, a public good—a benefit to the whole kingdom?

Wenlock.—The distribution at this school of the various prizes awarded by the Department of Art, at the recent examination of the Borough of Wenlock School, which has its central school at Coalbrookdale, has just taken place. The principal residents in the Dale, and a large number of friends of the recipients, were present. The medals and secondary rewards, according to the Report, may be classified as follows:—

	1862.	1863.
Local Medals	8	10
First Grade Prizes	33	65
Second Grade Prizes ...	22	11

Last year four students received their prize studentships. The number of students upon the registers of the central and branch schools was, in 1862, morning class, 25; evening class, 60. In 1863, morning class, 18; evening class, 42: and in each year the number of children in the seven schools in the district, which avail themselves of the services of the master for instruction in drawing, is reported as about 1,066. There has been an apparent diminution in the number of pupils; but this circumstance is attributed to temporary and local causes. The money prizes offered by the Coalbrookdale Company and Messrs. Maw, for competition among the artisan students, produced a number of works which evidenced great merit, particularly in the class of original compositions, in which the competing works were excellent, affording promise of additional satisfactory results. Similar prizes are again offered by both firms.

GWYNN AND MYLNE.

EARLY THOUGHTS ON THE COFFERDAM SYSTEM.

MAY I add a few additional facts to my "Biographical Sketch" of John Gwynn, R.A., which appeared in your last volume (p. 455), and to which reference is politely made in the remarks on Mylne last week? I lately turned up among my own books a copy of one of the little publications which I had named but had not seen; it has proved to be very useful in affording information of Gwynn's early literary attempts. It is "The Qualifications and Duty of a Surveyor explained. In a Letter to the Right Honourable the Earl of ******. In which the Essential Accomplishments are particularly described and considered. Necessary to be perused by all Persons concerned in Building." 8vo., 1752, price 6d., 28 pages, and without name, Followed by "A Second Letter, &c., with some further Remarks on their supposed Imperfections. Necessary," &c. 1752, price 6d., 33 pages. It contains that story of an intelligent surveyor who could not read the blacksmith's bill, and deducted from it more than the charge, which

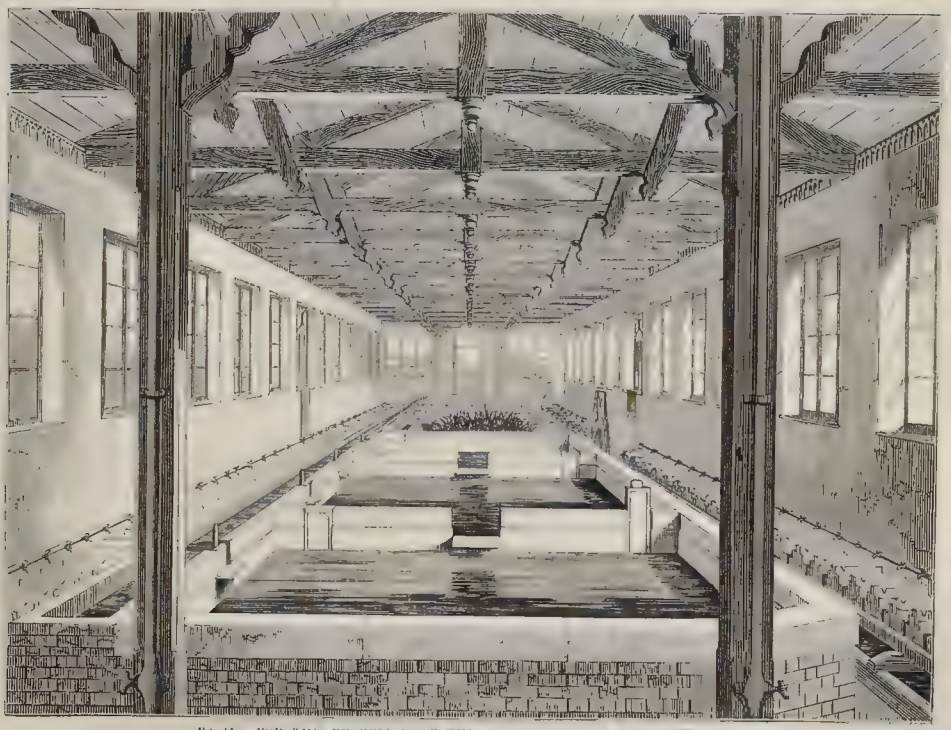
HUNINGUE.

THE HALL OF INCUBATION, IN THE RIGHT WING.

Jos. MacPacke (alias Peacock, in his "OIKISIA," published in 1785, puts forward apparently as his own. The following "Tracts, wrote by the Author of this Letter," are mentioned as for sale: "An Essay on Harmony as it relates chiefly to Situation and Building; price 6d." This is already named by me as published in 1734. Then follows "The Art of Architecture, a poem, in Imitation of Horace's Art of Poetry, price 1s." This was published, as he states in the text of "The Letter," in 1742. Then succeed, "An Enquiry after Virtue, a Poem, price 1s.;" "Part the Second, being an Appendix to the same, price 6d.;" and lastly, "Rupert to Maria; an Heroic Epistle, with Maria's genuine Answer, price 1s." The "Essay on Design," published in 1749, is not mentioned.

This list, from the detail given, is further of interest in the matter, on account of the passage, underlined for italics, as of course it is not brought forward so prominently in the original, in the following rather long extract, which I have ventured to append. The words are, "for he was till of late of another profession." This was written in 1760, and the above-named publications include his productions from 1731, but do not elucidate his "profession." unless it may be presumed that of "surveyor" is simply meant; whereas in 1760 he was putting himself forward as an "architect," by sending in a design for Blackfriars Bridge; and at which period he appears only to have been known by his drawing of the section of St. Paul's." Besides this section, I have seen a large plan of that cathedral, also bearing the names of Gwynn and Wall; it was published June 26th, 1755, in two sheets: the dimensions are carefully figured.

A few days since, seeing in a catalogue the title "Observations on Bridge-building, and the several Plans offered for a New Bridge," 8vo, 1760, I became the purchaser of it. No name appears, but the word PUBLICUS is appended to the last page (50), and there are eight more of "postscript," which, from the wording of the first paragraph, intimates that my copy may be a second edition. The so-called "letter" is "addressed to the Gentlemen of the Committee appointed by the Common Council of the City of London, for putting in Execution a Scheme of building a new Bridge across the Thames, at or near Black Friars."* The writer first gives his own notions of what is required, and then criticises the eleven designs selected. As this pamphlet appears but little known, I offer the following remarks as specimens of contemporary criticisms. The text shows that the designs by Mylne and by Smeaton had *elliptic arches*, the others being all semicircular. This is a point which has not been heretofore noticed. Of Chambers's design the writer says, "This plan has a grand, a lofty, and a magnificent appearance at first sight. His thought of making this bridge a triumphant one is glorious, and well becoming at present the dignity of the English nation;—a beautiful piece of architecture, which stands upon the middle arch." On the whole, however, the author does not approve of the design. What has become of it? Evidently the decision lay between the productions of Gwynn and of Mylne. The latter has the longest criticism of the whole number; but to copy it would be trespassing too much upon your pages, especially as the structure itself is so well known. I may, however, probably be allowed to complete my "biographical sketch" by an extract of the remarks on the design by Gwynn:—



"This design at first sight strikes me something like looking at a Turkey carpet; where one is pleased with the whole because of its variety of colours; but when our attention is taken up with any single part, we are dissatisfied, and wonder how any one could throw away so much labour in making these parts, which have no resemblance or connexion with what one might expect there. This gentleman, when he sat down to invent, had some ideas of producing a thing striking and magnificent, but the manner in which he has done it, renders it a trifling gew-gaw. Although there may be a difference in taste, yet I find that everybody agrees when the magnificent is procured by the simple and the genuine, it pleases universally all ages and nations. Witness the Ægyptian, the Greek, the Roman buildings. Witness, for example, Covent Garden Church. Is there anything tawdry there? Are any pastry-cook ornaments hung on it, to deck it out, which fashion in half a century might find fault with? No; that rigid virtue and severity will convey the sublime idea to all ages, when fashion will condemn, and time will have mutilated everything that looks like candy'd sugar. This is treating it in a poetical sense; but this otherwise ingenious gentleman might have known, if he had received a regular education (*for he was till of late of another profession*), that there is a certain circuit of forms in architecture, produced by the materials of which it is composed, from which a man should never deviate. If he had considered the connexion and almost sameness of forms produced by the Druids, the Mexicans, the Ægyptians, the Greeks, the Etruscans, he would never have deviated so far from stone and lime as to borrow a form from the foot of a drinking-glass or front of an organ. Yet this is his taste, and of that species which commonly last from one birthday to another. The drawing part is very well executed, and for that purpose, I have been told, he had the helping hand of Mr. Wall, who goes partner with him in this venture. There is placed upon the two middle piers a group of small columns, like organ-pipes, to support either a recess or a clock. The form is taken from those of Westminster Bridge, which look more like a sentry-box than any form produced by the squareness of stone. There are no more columns till you come to the piers next the shore, and those intermediate ones are covered by a thing like twisted glass, which supports—what are things of vast importance to the benefit of mankind—a globe or a pine-apple! The groups of columns next the land, being shorter than the middle ones by the fall of the bridge, and not intermediate gradation between, look like dwarfs of columns or overgrown bannisters. By showing the joints of the arch-stones which tend towards the centre of the arch, and not the cross ones which make the length of the stones also, the arch looks as if it was composed of deal boards, or beams lying side by side. In short, the whole of the ornaments are of a piece with these examples, in illustration of which I shall lose no more time.

* If we remember rightly, Dr. Johnson published a pamphlet on this subject.—ED.

THE FRENCH PISCICULTURAL ESTABLISHMENT AT HUNINGUE, NEAR BASLE.*

VIEW OF PRINCIPAL BUILDING, CONTAINING THE OFFICES AND LABORATORY.—M. Coste, Member.

BASINS FOR THE RECEPTION OF THE YOUNG FISH, IN THE LEFT WING.

[* See p. 21, ante.

The height 28 feet of the great arch from high water, and the width 84, might have been a little more, for the easy passage of the tide and barges without giving any inconvenience otherways. The height of the arches next the land is so much, that the forced earth is 21 feet, which upon consideration of what has been said on that head in Mr. Dance's plan, will be found to be a great deal more than necessary, as no advantages accrue from it. All the arches are semi-circular, and the piers in such proportion to them, as would render it strong."

The writer uses the term "forced earth" for the "made earth" used in making up the road-way at each end for access to the bridge.

I must beg space to quote one more passage, relating to the mode of constructing the piers, as it is so much to Mr. Dance's credit, the then clerk of the works to the City. "The manner in which he proposes to lay the foundation of the piers, he says, is no chimera, because it is an invention of Vitruvius. It is a lamentable case that all the inventions of great men come under a disrepute, by being made use of by people less knowing. Vitruvius recommends in building a mole, to make an enclosure all round, and pump the water out, so as to make it dry; and this only in such places of the Mediterranean Sea where no Puozzollo earth could be found. Mr. Dance might have observed that Vitruvius recommends this in a sea where there is no rise and fall of tides. The greatest size that can be found for piles is 14 inches square; so that the strength of these piles, 17 feet long and 11 inches thick, is the most preposterous thing ever proposed, even although there should be a double row, with what he pleases to put between, to support a body of water 24 feet deep, in continual motion against the sides of this enclosure, and having the weight of 8 feet of silth all round on the outside of it. He surely would not have thought it eligible to be put in execution." Evidently (as we know), "cofferdams" were not then believed in. Further on, in his criticisms on Smeaton's design, he says, "He proposes to build the piers within an enclosure or batter-dean, for my sentiments on which you'll be so good to turn over to what is said in that respect of Mr. Dance's plan." And in the postscripts he writes, "That he has proposed to build his piers in an impracticable method, when he proposes to build them upon a dry bottom. For allowing him to make his enclosure strong enough to resist the water on its outside (which I doubt much of), yet the bottom of the river, being a gravel, cannot resist the weight of water on it; but by the openness of its texture, will allow the water to boil up in the middle of the enclosure. When ballast is dug out of the river Thames, the barges never shift their place, for the gravel comes boiling up in the same place always, as they take it away; how much more so would water come, if such a weight of it as 30 feet was pressing on the outside of the enclosure?" The writer of this would be rather astonished at what is now done with this principle of constructing foundations in water.

I am also able to add another bridge to his works, through the kind assistance of a friend. On the 27th of July, 1769, was laid the first stone of the bridge over the river Severn, at Atcham, four miles below Shrewsbury, consisting of seven arches, of less span and width than the bridge also by him, at that city. The inscription on the stone is given in the *New Universal Magazine* for 1814, p. 343, in a biographical account of Viscount (if I remember rightly) Hill, one of whose ancestors, "Rowlandus Hill, Baronettus," laid the first stone; and it may also be found in Gough's edition of "Camden's Britannia," fol., 1789, ii. 417. It appears that the "bridge of Terne," noted by me, and mentioned by many authors, as one of his works, is not to be so included.

WYATT PAPWORTH.

THE CLAIMS OF ART UPON AN AGE OF BUSINESS.

IN the course of the address on this subject, delivered by Mr. Gambier Parry, at the recent meeting of the Gloucester School of Art, Mr. Parry, after speaking of the light the English had made for position, said,—I do not see why we should not eventually excel in art, if only we go about it in the right way. Hitherto as regards art we have been a nation of contradictions. For instance, in the genius of poetry, which is the very life-blood of the arts, where was there ever a nation more brilliantly, more variously endowed, than that of Chaucer and Spenser, Shakspeare and Milton, Byron, Tennyson, Browning, and every gradation of spirit between the spice of old Ben Jonson and the sentimentality of Moore? But in other arts we have had no such pre-eminence. I do not believe that we have lacked genius, but simply that it has been dispirited by public indifference. Take our painters for instance. It was but comparatively a few years ago that the greatest of our landscape painters, and he the greatest in that branch of art that the world has ever seen—I mean, of course, Turner—so grieved at the want of public encouragement, ordered his greatest picture to be made his winding-sheet. That picture is the famous one of Carthage, now in the National Gallery. He was happily bullied out of his intention by his good-humoured friend Sir Francis Chantrey, who wound up a long argument with him by saying, "Well, my boy, if you will be buried in that picture, we will most certainly have you up again the next morning." The lives of our artists have too often been tales of disappointment and sorrow, because the hearts of our people have not been trained or open to love the arts. If in those arts a genius has been born to us, he has been like a star without a heaven to shine in; or, at any rate, the British public was by no means the kind of heaven that would have suited him. People like to have their ugliness perpetuated in portraits. Portrait painters, bad and good, got on equally well: portrait sculptors, bad and good, got on equally well; pictures which two generations after were usually consigned to the attics or converted into a target; busts which two generations after were usually consigned to the garden wall for a family cock-shy. But for works of higher art there was no public sympathy. It has been only within the last thirty years that they have opened their eyes to the merits of such men as Hilton, Opie, and Etty. Our people have not cared for ideal art. Their taste in such matters has been for that which gave them no trouble to think about—hence our most popular artists have been the representers of domestic scenes or simple natural subjects which told their own story at once, like those of Wilkie and Landseer. The works of these great men were full of poetry, but it was not so much the poetry as the simple facts which our people cared for. How could they?—for it had been a sealed letter to them. Then turn for a moment to other arts. Take music. We have had deep and sweet musicians—we have no need to blush for Purcell, Farnant, Crotch, Attwood, and Bishop,—but whom had we to compare with Bach and Beethoven, Mozart and Mendelssohn, Spohr and Rossini? Then turn to sculpture. Whom have we had except the almost unrivalled Flaxman, and in portraiture the equally great Chantrey? In architecture, alas! how few! The taste of the times was enough to crush all genius. So men miscalled artists and architects contented themselves by copying and repeating what had been better done centuries before in Verona and Venice, Genoa and Rome. No! strange it may seem, that in poetry we may have excelled all modern nations, while in the other arts we had ingloriously lagged behind. But I deny our lack of genius in those arts. What we have lacked has been the power, the intelligence, the refinement, of the public to foster or to appreciate them,—and so they died. But the scene is changing now, and rapidly. Those realities in the romance of sorrow which made up the lives of so many men of genius are not likely to be repeated. Our people are opening their eyes and their hearts to the beauty of their works. And, what is a good deal to the purpose, since we have heard what prices have been paid for pictures, they have also lately been most decidedly opening their pockets. No, hitherto our people have had other resolute work to do; to conquer our soil, to master our waves, and to develop our resources. Time was when we were among the most artistic of nations. In the thirteenth and fourteenth centuries art schools flourished in many parts of England, and English art was highly prized all over the world. Then the tide turned the other way, and trouble came at home and abroad, and drove us to dull hard work again. We had our ups and downs of life. In the time of Queen Elizabeth, again, foreign ambassadors reported us to be among the "blythest, merryest, and most musical of people." What now, to go no further, what impression does this rapid sketch of our past doings produce upon us? I confess that my impression is strong. I feel it to be impossible that this country can have produced such genius as in her poets, such genius as in the sister arts of Wren, Gainsborough, Hogarth, Flaxman—it is impossible, I say, that such men, such poets, architects, artists, sculptors, should have come of our stock—few in number, but worthy to stand with the foremost in the great ranks of Christian art—and not feel convinced that there does lie beneath the surface of our society a power dormant only until public sympathy awaken with it, waiting only for the fostering warmth of public care, to come forth into full and beautiful and vigorous life. In what nation that has ever risen to pre-eminence has not the demand brought forth the man? How else should we have heard of the genius of Cromwell, of Nelson, of Napoleon? Men are often found where they are least expected. I am confident that there exists a capacity in our people to answer all demands. I believe that ambition to excel is not always vanity—but that there is in all our classes an honourable ambition to excel for the very love of the excellences of what it excels in. We have excelled in all else, why should we not excel in art? I firmly believe that we shall. Whether right or wrong, people's minds are now alive to an idea of taste, and the next thing they will be alive to will be an idea of beauty. But now you, gentlemen, who, however much you are engrossed in the hard business of life, yet have hearts for the social improvement and domestic happiness of your people, look at this great subject in still *another* way. Look at the effect which the pressure of competition, the universal obligation of hard work, is producing, especially in large towns. Men must have relaxation and refreshment. They will take it in one way if they cannot get it in another. They do not so much need repose as change of occupation. They will follow the bent of their own minds. They have been hard bound at work all day; they must have a fling of some sort. In the brighter air and brighter soil of Sussex and Kent, Surrey and Hampshire, they may and do take it out in cricket. But look at our large pent-up towns, and the difficulty of any good and sufficiently varied relaxation and refreshment for the occasional spare days and long evenings of our hard-working classes. You gentlemen in this city of Gloucester have well and generously gone to work in earnest to provide that those spare days and long evenings shall not be unprofitable. The lecture-room, the reading-room, the concert-room, are all going in the right direction. But they have by no means filled up every need. There is yet another quality of mind that you have to provide for—one inseparable from our nature: I mean the love of beauty. It is inconceivable that the whole creation should have been clothed with beauty without purpose—that all things, everything, should have been endued with that subtle quality without meaning, without object. We know it, we feel it, but we cannot grasp it; it is above and beyond our reason, but still it is within the scope of even children's thoughts. It fascinates us, we know not why. We judge of other qualities in things about us, that one is the measure of their strength, another the measure of their utility, but of their beauty we can only judge that it is the measure of their perfection. When I speak thus of beauty I mean no mere prettiness, no mere creature of fancy, no mere thing of outward show, unimportant, evanescent, to which all within is indifferent, and could dispense with it. Who could wipe off the beauty of a humming-bird? Who could pare down the beauty of a man, and that he could live? No! Beauty is as universal in nature as life itself—and for aught we know as important. It is inseparable from life. The love of it, the craving for it is a healthy appetite. The absence of it, whether in mind or matter, is an evidence of disorder and degradation. Here there is a quality common to us.

"One touch of nature makes the world akin."

Here is something for which library, reading-room, lecture-room, has ill provided, if at all. There is a blank. I think your school of art does fill up that blank. I speak of no sentimentality, but of a reality which is daily pressing on public attention more and more. I by no means wish to put art upon stilts. I by no means wish to put it on a false position of importance. But I believe it is this,—it is *the thing* which is wanted to trim the balance of our national character; to correct its hardness, its coarseness, its vulgarity; and to draw out its *finer* and not less noble qualities. I look upon it as a great field which we have left uncultivated. I believe that thousands of our workmen have been forced into trades unsuited to them,—occupations which were repulsive to them. The world has dealt harshly with them. The idea of a common working man having tastes and talents, definite and refined aptitude,

and even genius, hidden beneath his rough exterior, has been ignored. His heart has yearned for other things. He has felt like a race-horse harnessed to do cart-horse duty. He has become indolent, depressed, dispirited. His temper embittered, his life resourceless, has driven him to vice for relief, and then vice has driven him into crime. I suspect that this is neither an exaggerated nor uncommon picture that such a man as I describe, who might have been happy in himself and an honour to his family, has become an outcast and a criminal. The character on which such misfortune as this is most apt to fall is that of the genuine artist. I know that the artistic spirit is impatient of control, impulsive, erratic; that it loathes red-tapeism and routine; it hates the unsuggestive ledger and the hideous office of regular Anglo-Saxon life. But you can't put an extinguisher on it, you can't put out its fire, you can't get rid of it. You have got it, and you will have it always about you somewhere. You must accept it with all its errors, its impulses, its fire, and its impatience. The only thing for you to do is to *employ* it. You must put it to its *right* wheel. It will not turn every wheel. The man who would blunder your accounts, lose the key of your office, and put you into a commercial fever, would have done you good and noble work if you had only put him to the work for which God made and fitted him. Every man in Staffordshire was not born to make tiles and pots; every man in Sheffield has not a genius for knives; no. Remember what class the great geniuses of the arts have arisen from,—that Giotto was a common, not an uncommon shepherd boy on the mountains; that our Stanfield was a sailor; our Turner the son of a poor barber. Conceive if Turner had been forced into his father's trade, just as the sons of Egyptian mummy-makers were screwed down all their lives to do nothing but make mummies! Conceive, I say, our great landscape painter, Turner, forced into his father's trade, to spend his life in cutting hair and plaiting pigtails! Why his heart would have been in the highlands; he would have trimmed people's heads like trees, and cut their whiskers into hedgerows! Remember, too, what poor Hogarth was; that Tintoretto was the son of a dyer, Pallajolo a poor apprentice, Andrea del Sarto the son of a tailor, and Correggio as poor as a rat. Perhaps, after all this you will say, "Ah! but this is a commercial country; we must live by our trade,"—

> "Men must work and women must weep,
> There's little to earn, and many to keep."

But I say that your men would work better, and your women would weep less, if you only studied a little more to put people into their right places, and to do the right work; if you would not always be forcing a round man into the square hole, and your square man into a round hole. Look what other nations, equally commercial as you, have done. What do you say to Venice, to Pisa, to Genoa?—little kingdoms of merchants. I know that their political and social life will not bear comparison with ours for a moment. We have had the experience of the past to mould our wisdom to. But see how they turn every man to account, how they put him to grind at his right wheel. How grandly did their commerce flourish, and how grandly did their arts flourish side by side with it! If you admire the energy of their trade, admire too, I pray you, their cultivation of the higher sentiments, tastes, genius of their fellow citizens. They made money, they accumulated wealth. What else were trade and commerce made for? But see how they use this wealth. A public spirit ran through the whole community: noble monuments, religious foundations, schools, hospitals, were their work; they covered their public buildings with frescoes and mosaics, to fill the eyes and hearts of their children's children with the scenes of their country's glories; and they strove together to make their cities beautiful. Now turn to London. Is there any merit in the dulness of its streets? Is there any virtue in the poverty of its architecture? Is there any piety in ugliness? Out with such Puritanism, and do not let us profess as modesty that which is simply meanness. Let us not blink this fact any longer, that people—the commonest, the lowest—are open to the deep and noble impressions of external things: that depressed and sordid minds are capable of elevation by objects of beauty: that cheerful streets, bright open squares, noble monuments, and graceful arts, do content and cheer and animate a people.

But there is a nobler spirit rising rapidly among us. We have brought up our people to value only what was useful. We see the mistake. We see the materialising, brutalizing effect of separating the beautiful from the useful. We had been going directly counter to the whole order and tenor of Creation. We see how God's works are in no single instance useful without being beautiful. Yes, beautiful not only in construction, beautiful not only in aptitude, but beautiful in plain abstract beauty. We are opening our eyes to a new and real wisdom—we are offering to men and women means of occupation and opportunities of expanding what talents they possess in an atmosphere and a manner congenial to them. The capacity for artistic pursuits among our people is being developed with a rapidity as great as it was unexpected. We have always been a people famous for our ingenuity. *Practical* art is but cultivated ingenuity. The demand for artist-workmen is increasing daily. Buildings are rising in all our principal towns demanding skilled hands in all forms of design and execution. Our art-manufacturers are beginning to compete successfully with those of the most artistic nations. Our art-schools are turning out accomplished draughtsmen, and scattering widely a general knowledge of art-principles among hundreds of pupils annually. Let this then be our line. We shall be no more forcing the race-horse to do cart-horse duty. The dock and the counting-house, the labourer, the mechanic, and the accountant, will go on still; only the artist, who put them all out, will be drafted off to do his own and his proper work. If then by such means as all these we can supply the increasing demand at home and abroad for better style and purer design in all our manufactures, our woven fabrics, our china, our glass, our metal work, we shall have made a great gain commercially. If by these means we can improve our cities, clear them of the eyesores of modern vulgarity, and erect monuments more worthy of our times, we shall have gained in the cheerfulness of our people, our own self-respect, and in the honour of our neighbours. If by these means we can supply fresh opportunities of employment, fresh occasions of enjoyment, fresh outlets for the various talents of our mixed race, I think then, ladies and gentlemen, that we *have* founded a claim for art "upon an age of business"—and I trust that we shall make it with success.

"TATTERSALL'S."—THE NEW BUILDINGS, KNIGHTSBRIDGE.

THIS arcum, with its several buildings, is now in a sufficiently advanced state to show the general design of the architect, and give a definite notion of the extensive arrangements which are being made for the increased accommodation and comfort of the Jockey Club, its subscribers, and the general public. The plot of ground upon which it stands is nearly two acres in extent. It is approached from the east by Knightsbridge-green; and the *façade* consists of two square wing-blocks of yellow brick, with stone dressings, pierced with six windows each, and surmounted by a stone parapet with ball terminals. These blocks are divided by a pedimented gateway, carved, and two side entrances. The left-hand block is dedicated to the subscribers; the right to the secretary's offices, business departments, harness-rooms, and the private dwelling of the superintendents. Although this entrance presents a comparatively narrow face, the space within gradually enlarges to a depth of 300 feet, until it increases to more than double the width of the façade. The subscription-room is approached by a side foot entrance, railed off from the centre road so as to preserve to its frequenters the utmost privacy. It is entered by lofty double mahogany doors; is 60 feet long by 30 feet in width; while a clear height of 26 feet 6 inches is obtained. It is lighted by day by two large domes, 18 feet high, covered with lunette lights, each formed of one large piece of glass. A third dome is in the centre of the ceiling, in which an enormous sun-burner is placed to illuminate the whole by night. The principle, which is that of Messrs. Forrest & Son, of Fetter-lane, is peculiar; by a duplex arrangement, the whole of the ceiling being lighted and not thrown into shadow, or half tint, as by most of the ordinary means, these domes are bordered by a *guilloche* pattern, and will be enriched with coloured devices. The walls are divided with the same *guilloche* border, and will probably receive painted decoration. The floor is to be paved in a geometric pattern, with ornamental tiles, as a repeat, and in harmony with the decorations of the ceiling. A raised daïs, about 6 inches in height, surrounds this room, and is skirted or edged with marble, the pattern of the external tile design carried out upon the daïs being repeated, as a border to complete the whole of the floor. Upon this daïs seats will be placed. Under each of the two extreme domes, a large octagon slab of marble will support the desks appropriated to the recording of wagers, the writing of letters, despatches, &c. At the south-west corner is another set of folding-doors which lead into an area of about 70 feet by 40 feet, for open-air betting, somewhat similar to the present "lawn," but paved, in this case, and provided with many conveniences, and amongst the latter will be the telegraph-office. The room is warmed by two open stoves, lined with Minton's tiles, and surrounded by appropriate chimney-pieces, from the marble-works of Warwick House, Regent-street, and surmounted by pier-glasses.

The central entrance leads onwards through a tall iron gateway, over a granite tramroad, for heavy traffic, into the principal public yard, 108 feet long by 60 feet wide, for sales by auction. In the centre of this area will be found the old and familiar Temple of the other premises, at Hyde Park-corner, with its Fox, and the bust of George the Fourth, when young, at the top, and in the north-west corner the pulpit of the auctioneer. The whole of this yard is covered by a roof of Hartley's Patent Glass, 150 feet in length, 102 feet in breadth, and 60 feet high. It is supported on iron girders, and constructed to admit or exclude at pleasure the external air, and thus obtain the greatest amount of ventilation. Surrounding and opening into this enclosure are some of the stalls and loose boxes. Behind the north and west portions of this inner row of stalls, is a wide roadway, upon the sides of which, entirely free, are loose boxes, some of them for entire horses, and mares with their foals: the dimensions of these are 12 feet by 14 feet. These are lighted by a ventilating louvre top, to which all foul air is at once carried without retardation by the form of the sloping roof. The doors are likewise provided with the means of additional light and ventilation. All the divisions of the stalls are boarded up to 5 feet 6 inches in height with elm planking, and have iron cappings. A system of trapping the drains, rendering each independent of its fellow, is likewise observable in these divisions. We need not add that there are numerous corn-rooms, hay-lofts, washing departments, gas and water to each stall, &c.; but we may not pass the manure-pits without saying they are arched over, and that effluvium is carried aloft by shafts. Nor should we omit to state that above the inner square of stables, and equally beneath the protection of the glass roof, is a gallery running the entire length of the oblong square, for the repository of carriages. Under a portion of this gallery the tramway terminates in a turn-table, upon which the carriages rest, and are raised and lowered upon it to or from the upper lever by Easton & Amos's hydraulic apparatus, which is set in motion by simply turning a tap, the machinery being similar in principle to that now used at the monster hotels. Mr. Charles Freeman, of Lincoln's-inn, is the architect; and Messrs. Holland & Hannen are the builders; the clerk of the works being Mr. B. Pyle.

ADOPTION OF THE LOCAL GOVERNMENT ACT AT BOWDON.

ON Saturday afternoon, a meeting of the ratepayers and owners of property in the township of Bowdon was held, to take into consideration a resolution for the adoption of the Local Government Act; the Rev. W. Pollock, the vicar, in the chair.

The chairman said, that in the event of the Act being adopted, and being found to work in an unsatisfactory manner, they had the power of getting rid of it in the same way that they adopted it. He moved the adoption of the Local Government Act, 1858.

Mr. W. E. Lycett said he would briefly explain that the clauses of the Act embraced all powers necessary for the good government of a town, but the only clauses it was imperative on them to adopt were those connected with the health of the inhabitants. They were required to drain and sewer the township; but all the other clauses were merely of a permissive character. Some parts of the township were strictly agricultural, and others partook of the nature of a town.

The closely inhabited parts were in greater need of a complete system of sewerage and drainage than the agricultural portion.

Mr. Alderman Neild said the drainage of the township was in a truly horrible state. There was not one man in twenty in the township who was aware of the danger in which he lived owing to the want of drainage, and it was their duty as Christian men to join to obtain the Act which, if the right men were selected to carry out its provisions, would prove a blessing to the township.

On the motion being put, it was carried by a majority of 17 to 36. The minority was composed principally of women and labourers.

THE DESTITUTE HOUSELESS POOR IN THE METROPOLIS.

THIS is a subject on which we have more than once treated of late; and we are glad to note that the Central Poor-Law Board has taken it up. A minute on the subject has just been issued, in which the Board say:—

"The Poor-Law Board have recently obtained from the several metropolitan unions and parishes returns showing the extent of accommodation provided for destitute vagrants and wayfarers, and the numbers who either received, or who were refused, a night's lodging during the first week of each of the months of January, March, May, and August, 1863.

It appears from those returns that, in the aggregate, accommodation is provided in the several metropolitan workhouses for 997 such persons.

But the accommodation is very unequally distributed.

It is unnecessary to remark that to provide lodging for every applicant indiscriminately in this vast metropolis would encourage vagrancy and imposture of the worst description, and perpetuate all those evils which were pointed out by the Board in their minute of the 4th of August, 1848.

But the obligation upon the guardians and their officers to afford the requisite relief to all really destitute applicants is, nevertheless, imperative, and cannot be evaded.

The next consideration, therefore, which arises is with respect to the manner in which relief can be provided with the least liability to abuse.

In every union, or parish not comprised in a union, there should be, either in the workhouse or elsewhere, proper and sufficient wards, according to the special circumstances of the locality, for destitute wayfarers and wanderers; and means, such as the law contemplates and the Poor-Law Board have frequently suggested, should be provided, with the view of testing the real condition of each applicant.

In unions and parishes where the existing wards and workhouse accommodation may be insufficient, the Board consider that it is the duty of the guardians to make such further arrangements, whether permanent or temporary, as will insure for every wanderer and wayfarer actually destitute, and applying there for food and shelter, sufficient protection and relief for the night.

The Board have decided that the master of a workhouse within the metropolitan district may properly admit, under the above regulations, any person who may be brought there by a police-constable, and described as having been found abroad in a state of destitution, the presumption being that the applicant has been guilty of no offence that would authorise his detention in custody.

It is the duty of the relieving-officer also, in every case of sudden or urgent necessity, to relieve every destitute applicant, either by offering admission to the workhouse, or providing, so far as practicable, all such necessaries as may be actually requisite, without reference to the time of application or to the place where the pauper has last slept.

The Board are desirous of impressing upon Boards of Guardians the importance of giving special directions to the master and matron of workhouses, and also to the porter, that whenever the workhouse or vagrant wards are full, they should be extremely careful to inform all applicants for admission of the residence of the relieving-officer, in order that the requisite relief may be supplied by him.

Printed tickets with the name and residence of the relieving-officer should be provided and delivered in such cases by the master, matron, or porter, to every applicant.

Under the existing law, if properly and judiciously applied, sufficient arrangement may be made for affording relief to every destitute person without incurring the risk of encouraging vagrancy."

The minute, which enters into other details as to the respective duties of the masters, matrons, and porters of workhouses, concludes with a hope that these officers will give practical effect to the minute, which is signed C. P. Villiers, President.

LONDON COW-HOUSES.

A MEETING convened by the London Cow-keepers Association has lately been held, to protest against the refusal of licenses for cow-sheds.

It is very unwillingly that we oppose a class of respectable tradesmen; but the public health is of greater importance than the interests of a small section of the community; and each month's experience shows that the keeping of cows in dense populations is injurious to health and unwholesome for the animals. Moreover, we believe that the removal of the cows to the open country will be found eventually to be of advantage to the proprietors, and that those who are so violent in their opposition will in the end be as well satisfied as the undertakers now are with extramural burial, and those connected with offensive trades with the removal of their quarters. We hope that the magistrates will continue to resist firmly the licensing of cow-sheds in London as much as possible; and we would urge the cow-keepers, instead of offering opposition, to consider how they can with most advantage conform to the necessities of changed conditions, and the peculiarities of the metropolitan population.

REPAIR OF LONDON SEWERS.

At the meeting of the Metropolitan Board of Works, on the 1st inst., the engineer, after reporting the satisfactory progress of the Main Drainage works, presented a report on the works necessary to put all the existing main sewers in efficient working condition, with the estimated cost. He said that the main sewers should be rendered more efficient, and that the total estimated cost of the necessary works amounted to 800,000*l*. There are 165 miles of main sewers, of which 105 miles are on the north side, and 60 miles on the south side of the Thames. About one-fifth of the number are open sewers, and portions of the covered sewers are defective and require extensive re-construction. It will not be necessary to do a portion of the work for some years to come, but the works which should be immediately executed would cost 270,000*l*. As it is probable that the metropolitan area will be extended by the erection of additional houses, the engineer suggested that the entire sum of 800,000*l*. should not be raised at once, because hereafter there would probably be a greater number of buildings chargeable with the expense. He, therefore, proposed that they should raise year by year the sums required to carry on the works.

CURIOUS DISCOVERY IN GLOUCESTER.

It may not be generally known, or it may possibly be forgotten, that in the olden time county families often came into their principal city or town for some of the winter months, where they had their regular town houses, and those who had not, bestowed themselves in lodgings. A visit to the metropolis was then a much more serious business than it is now-a-days. Folks were then content with the amusements the city afforded them: the theatres, the assemblies, parties, &c., were a sufficient attraction; consequently many fine old mansions will be found in our principal towns, now devoted to very different purposes from what they were originally built for. One of these abodes, the town house of the Guises, a mansion of about Queen Anne's period, has of late been occupied as a school of art; and in making some alterations for this purpose the architect observed an unusual and, as it seemed to him, a needless projection of panelling in a small sitting-room, always called "Pope's room." He made up his mind to remove this projection, and in doing so brought to light a fine portrait of Pope. This led him to suspect that the opposite side might also contain some treasure, and on taking it down a painting was revealed, since said to be the "Temptation," by Guido. A man in a rich dress of the time of François Premier is holding up a string of pearls to a woman, who appears to be resisting his entreaties and tempting offer. It is described to us as a remarkably fine painting.

Pope was a frequent visitor in Gloucestershire and the neighbouring county of Hereford. His well-known lines to the "Man of Ross" were written during his sojourn in the neighbourhood. In Gloucestershire he was a guest of the family of the Guises, who had a seat, Highnham Court, not far from the city; another, called Rendcombe, in the same county; and the house in Gloucester alluded to. He was also a not infrequent visitor at the Bathursts', Lydney Park, near Cirencester.

Why these pictures were "walled up" one cannot form any reasonable conjecture: there were no public troubles in Gloucester at that time. Are we justified in attributing their concealment to some anticipated family dispute respecting them, which might have been avoided, perhaps, by thus shutting them out from the world? Fortunately they were in a dry place, on each side of a fire-place, and have received no injury from their long imprisonment.

The pictures are now in the possession of Mr. Baylis, Thames Bank, Fulham.

TRACTION ENGINES.

THE late visitor to the Kensington Museum of Patents will have scarcely failed to observe the famous Wylam Colliery engine, "Puffing Billy," one of the first locomotives ever made. Appropriately appended to this remarkable relic is an ancient document, the perusal of which will show it to be the written opinion of an eminent barrister of bygone times, that locomotive engines could be indicted as a nuisance, from their noise being a cause of disturbance to grazing cattle. A modern improvement in land-transit, of only secondary importance to that of the use of the locomotive on the rail, is the employment of the traction engine on common roads. The introduction of these engines has to meet similar obstacles to those encountered by railways during the first decades of this century. "Traction engines frighten cattle,—traction engines destroy the roads, traction engines take up too much room in the roadways." Similar are the cuckoo cries against every innovation. Trains moving at the rate of fifty miles an hour often run parallel to long lengths of road; thrashing-machines, that have been commonly used for the last fifteen years, take up more room than a traction-engine; the hoofs of horses injure roads to a greater extent than the wheels of carriages. We noticed that a special meeting of the waywardens of the Faversham Highway Board was held on the 28th of December, for the purpose of considering a resolution to the effect that in the opinion of the Board the use of locomotives on the public highways is dangerous and inconvenient to the public; and therefore that an application be made to the Home Secretary, under the powers of the 24th and 25th of Victoria, cap. 70, to prohibit the use of all kinds of locomotives on any highway whatever within the district. On a division, we are glad to say, only two hands were held up for the prohibition, and more than fifty against it.

According to a careful estimate, the cost of removing twelve tons of material a distance of ten miles gives a difference of 1*l*. 8*s*. 8*d*. in favour of steam as compared with horses.

CHURCH-BUILDING NEWS.

Lutterworth (*Leicestershire*). Misterton Church has been restored and re-opened for divine service. The cost of restoration about 2,500*l*.—has been (with the exception of donations from the churchwardens, Messrs. W. Daniels & Henry Bond, of 50*l*. each) borne by the Rev. G. H. Franks, the rector. The pews which were of old form, with the pulpit, desk, and other fittings, have been removed and given place to others of a more modern character, embellished with tracery and carving of a great diversity of pattern, uniform, and in the style of the old ends, a number of which have been restored and replaced. The seats are open. The pulpit and desk, like the seats, are of oak, carved, and placed on either side of the chancel. The floor of the latter is paved with tesselated pavement, especially within the altar, which consists of alabaster and stone. The inner part of the south aisle, with the east end of the nave, has been rebuilt: the chancel arch is new. The

brick buttresses on north side and part of north aisle have been removed, and others raised to correspond with those on the south side. The roofs are boarded, stained, and oiled, and covered with mulled lead throughout. The plastering and masonry of the exterior have been renovated. The soil to the depth of 3 feet around the lower base of the structure has been removed. The porch has been restored and supplied with a pair of gates. The lower part of the south door consists of panels in imitation of folding drapery, whilst the upper parts are filled with tracery and carving. The font, standing in the middle aisle, near the tower, is surmounted by a cover of polished brass. A new organ, by Messrs. Bates & Son, has been erected and placed on the right side of the pulpit. A warming apparatus has been added, the pipes of which are under the floor and covered with an ornamental grating designed by the architect, Mr. W. Smith, of London. The whole of the contracts were taken by Mr. J. Law, builder, Lutterworth.

Birkenhead. — St. Paul's Working Men's Church, Birkenhead, erected on the site of the schools which formerly stood in Argyle-street, at the corner of Market-street, has been consecrated by the bishop of the diocese. The edifice has been named from the circumstance that a service for working men was for a considerable time conducted in the schools, and the sittings on the ground floor of the new building having been appropriated to the working classes free of charge. The site, which cost about 800*l.*, was presented by Mr. Thomas Brassey, who has also given an endowment of 1,000*l.* towards the incumbent's stipend, as well as paid for a parsonage house at Clifton, which is equal to another 1,000*l.* The edifice occupies the north-west corner of Argyle and Market streets. The site of the church is quadrangular; and as the land was so costly, the building comes close to the parapet. Architectural effect has been obtained by recessing the walls to a considerable height from the ground, and by the arrangement of the roofs and tower, which present a broken outline. The plan of the church consists of a nave with one aisle terminating in an engaged tower. The basement consists of two large apartments, suited for Sunday or day schools or public meetings, and by being raised several feet above the level of the adjoining footways uninterrupted light is obtained. The interior of the church, which is treated in the style prevailing during the course of the fourteenth century, is simple. The front to Argyle-street consists of the gable of then ave, in which are three double-light windows under a deeply worked arch and drip mould, over which is a large wheel window, worked in a pattern of the hexalpha or two inverted triangles. Each spandrel formed by the triangles is again finished with quatrefoils. The gable itself terminates in a large stone cross. The ends of the gables where they join the gutters terminate in carved gurgoyles. The tower forms the angle of the two streets. It is slightly removed from the north wall of the nave, and terminates in a pyramidal roof, with a vane of metal work on the top, springing from a group of four lucarnes filled with louvres, over the bell-room. The total height from the footpath to the summit of the tower is about 72 feet. The elevation towards Market-street consists of a large centre gable and a minor gable on either side of it, and filled in with recessed foliated and cusped windows. The underside of the gallery, which runs along the side to Market-street, is lighted by ten cusped openings. The aisle is divided from the nave by four pointed arches, carried on iron pillars, with wrought-iron foliated capitals: these pillars also support the gallery. The communion is at the east end, opposite the entrance from Argyle-street, behind which is a reredos of carved timber, and above it the organ-loft, with a projecting gallery of timber supported on carved brackets. The opening for the organ is an arch in the east wall, supported by stone pillars, with moulded bases and caps. The organ itself has no case, but shows the pipes, illuminated in colours. The benches are open. The pulpit and reading-desk are, like the other fittings, of deal, stained and varnished. The roofs are open-timbered and plastered between the rafters, the woodwork being finished in stain, as the other portions. The altar-rail is of oak, and supported on floriated standards. The vestry is at the south-east angle, under the organ-loft, and fitted up with all the usual requirements. The church, having a lofty basement story throughout, will be dry, and in winter will be artificially warmed. The lighting is by means of coronæ, painted blue, and the prominent parts set off in gold. The cost of the building has been defrayed by public subscription, aided by the result of a bazaar held in Birkenhead Park, which produced over 1,000*l.* The building will accommodate 850 persons; all the sittings on the ground-floor free. Mr. Walter Scott, of Liverpool, and Birkenhead, was the architect, and Mr. John Hogarth, of Rock Ferry, the general contractor. The gas fittings were done by the local commissioners, and the warming arrangements by Mr. W. Bennett, of Liverpool.

Evershot.—The chancel and organ-chamber of Evershot Church have been consecrated, at the cost, principally, of Lord Ilchester, Mrs. W. Jennings, and Mr. A. Martin. The chancel has now been made to accord with the other portions of the church. The work was done under the superintendence of Mr. Shout, architect, Dorchester. Mr. Dendle, of Barnstaple, was the contractor. A stained-glass window for the eastern end of the chancel is being executed by Mr. Hardman, of Birmingham. The chancel is built of Forest marble, contributed from the quarries of Lord Ilchester, at Holt, and the dressings are of Hamhill. The walls in the interior are lined with Ham-stone ashlars. The carvings in stone were by Mr. Grassby, of Powerstock.

Scaldwell (*Northants*).—The parish church has been restored and re-opened. The architect employed was Mr. Slater; and the builder, Mr. W. Parker, of Thrapston. The work has been done under the superintendence of Mr. Thompson, the clerk of the works, under whose supervison the church at Kingsthorpe has recently been restored. When pulling down the chancel south wall portions of an old sedilia were found. The north aisle has been extended westward, and a new chancel south aisle has been built. There is a new arch in the south wall of the chancel, with the sedilia just mentioned and a piscina. There is a new arch opening into the south aisle. The old plastering has been hacked off the walls, and the old masonry has been scraped and cleaned. The jambs of the chancel arch are new, and the arches between the north aisle and the north chapel are also new. The plastering has been removed from the ceiling of the nave, the north aisle and north chapel, and the timbers have been covered with deal, and formed into panels, and stained and varnished. The roofs of the south aisle and chapel are new. The seats are chairs, made with a rest for the hats to be placed on under the chair, and a rest at the back of each chair for the prayer-books and hymn-books of the persons sitting behind in the next row. A kneeling cushion is also suspended on a hook behind each chair.

Sutton-on-the-Hill. — The restoration of the church here, dedicated to St. Michael, having been completed, the edifice has been re-opened by the Bishop of Lichfield. With the exception of the chancel the whole has been entirely rebuilt. It now consists of nave, north aisle, also organ chamber, and vestry, with access from the chancel. Two hundred and thirty sittings are provided. The principal entrance is on the north side, through a porch, facing a small avenue of very old yew trees, leading from the road through the church. The tower and spire together rise to the height of 105 feet, being 25 feet higher than the old one. The seats are open benches. The timber and boarding of the roofs, as well as the woodwork throughout, are stained and varnished. The pulpit, reading-desk, and reredos are all worked in Derbyshire alabaster. The east window is filled with stained glass, by Messrs. Hardman, of Birmingham. The chancel floor is laid with Minton's encaustic tiles—the remainder of the church with blue and white tiles. The building is warmed by one of Gurney's patent stoves. The style of the church is Early Decorated Gothic. The works have been carried out by Messrs. W. H. & J. Slater, builders, from designs and under the direction of Messrs. Giles & Brookhouse, of Derby, architects.

Birkenhead. —St. Paul's Church, Birkenhead, has been consecrated. The church is built on land situate at the corner of Argyle-street and Market-street, purchased by Mr. Brassey, at a cost of about 800*l.*, and presented by him to the working men of Birkenhead: hence it bears the name of St. Paul's Working-man's Church. Mr. Brassey also gave 1,000*l.* as an endowment, in addition to purchasing a house in Clifton-park, valued at another 1,000*l.* as a residence for the incumbent.

Malpas (*Cheshire*).— The Parish Church of Malpas has just undergone some improvement. The gallery at its west end has been swept away, as well as the ringing-loft which stood behind the organ in the tower. The tower arch is now seen in its entire proportions, and a pointed window in the tower, after long obstruction, has once more been recovered to view. The stonework of this window has been renewed. The interior of the tower, besides being entirely restored, has been groined with stone, and the window has been filled with stained glass. The subject depicted is the Ascension. The design was by Mr. H. Clutton, London; and the glass was executed by Mr. O'Connor.

Carlton-in-Snaith (*Yorkshire*). —The new church and burial-ground here have been consecrated. Mr. Atkinson, of York, was the architect of the church; and Mr. Elliott, of Goole, the builder. The edifice occupies an elevated site, and its spire affords a landmark for miles over the flat surrounding country. The east window has four lights, and represents Christ bearing the Cross, His Crucifixion, Resurrection, and Ascension. This window was done by Mr. Wailes, of Newcastle. On the south side of the chancel is another stained glass window put in as a memorial to the Hon. Agnes Stapleton, by her brother, Lord Beaumont. It is a simple figure of St. Agnes. All the other windows have stained glass borders. The font is carved in stone, and was the gift of the late Miss Stapleton. The organ was provided by Messrs. Foster & Andrews, of Hull. It is placed in the north aisle of the church, and is enclosed in a case the front pipes of which are coloured blue and gold. The greater portion of the works are built in a recess in the wall. The total cost of the church, including everything, is about 4,000*l.*, and is defrayed by Lady Beaumont. This includes the organ, which cost 170*l.*

Halesworth.—The restoration and enlargement of this church have been completed. The whole of the north side of the church, which was enlarged during the time that the late Archbishop Whately was rector of the parish, has been entirely pulled down and rebuilt; and a portion of the churchyard at the east end of the old chapel being inclosed within the walls, an entirely new north aisle has thus been formed, and additional sittings obtained. The architectural design is in unison with the other parts of the church. The new roof, of open wood work, is of foreign timber stained, and rests on carved spandrels. These improvements and additions have been made by the voluntary contributions of the parishioners and other personal friends of the late Mr. Andrew Johnston, as a memorial to him. The roof of the north aisle being sadly out of repair, and reported by the architect to be in a very dangerous state, a sum of money was voted by the parish for its reparation. A new roof has also been raised over this part as well as the porch. The entire work, with the exception of the glazing of the windows (which is the gift of the late rector, the Ven. Archdeacon Hankinson), has been performed by tradesmen in the town, the bricklayer's work by Mr. S. Howard; the carpenter's by Mr. J. Smith; the masonry by Mr. R. Balls. The architects were Messrs. Francis, of London.

DISSENTING CHURCH-BUILDING NEWS.

Kensington. — The new Wesleyan chapel, erected at Warwick-gardens, Kensington, has been opened for divine service. The building is in the Geometric style, faced in red brick, with dressings of Bath stone, and is from the designs of Messrs. Lockwood & Mawson, of London and Bradford. The west or principal front has a slated spire at the angle, rising to a height of 120 feet. The principal entrance to the chapel is in the centre of the façade, and consists of a double pointed doorway enclosed in a triangular head, and enriched by pierced tracery and surmounted by a finial. Above the doorway a large five-light window, with traceried head, forms externally, as well as internally, the principal feature in the design. The gable is surmounted and supported at the opposite extremity by carved pinnacles and gilded metal terminals, the side elevations being broken up by windows and buttresses to correspond. Separate entrances to the galleries are also introduced into this façade. Internally the chapel is divided by two rows of pillars into nave and side aisles, the central portion being of considerable height, and steeper in pitch than the side aisles. The roof is of open framed timber work, and, along with the galleries and pew-framing, is stained and varnished. The galleries run round three sides of the chapel, within the line of the pillars. Behind the pulpit

is a recess for the organ, decorated by a moulded arch, springing from slender stone shafts, with carved capitals and corbels. Accommodation is provided for about 1,000 persons. A semi-basement story, with open areas on both sides, is planned beneath the body of the chapel, wherein are provided schools and class-rooms, and a residence for the chapel-keeper. The warming of the chapel and schools has been executed by Messrs. Stuart & Smith, of Sheffield. The building contract has been carried out by Mr. N. Simmonds, of London. Mr. Dilworth acted as clerk of the works. The total cost of the chapel and schools, exclusive of the site, but including the spire and boundary-walls, not arranged for in the original contract, has been about 4,500*l*.

Bilston.—The foundation-stone of a new Congregational chapel at Bilston has been laid. The new chapel is being erected on the site of a former one, the removal of which was necessitated by its dilapidated condition. It will be in the Byzantine style, faced externally with red brick, with bands and dressings of Hollington stone. It will contain accommodation for about 600 adults, and will have a lecture-room, 52 feet by 37 feet, in the basement. The cost of the entire building will be about 1,150*l*. The architect is Mr. Bidlake, of Wolverhampton; and the builder, Mr. Hickman, of Bilston.

Selby.—The new organ for the Wesleyan chapel, Selby, has been inaugurated. The instrument is inclosed in a case of Grecian design, having semicircular towers, with a centre supported by Corinthian columns with carved capitals and painted cream-colour and gold. In this organ a new system of applying iron rollers to the finger movements is introduced.

Leek (*Staffordshire*). The new Congregational church and schools, which stand at the junction of Derby-street and Russell-street, have been formally opened. The style is Decorated Gothic. The materials used in the erection are Ladder-edge, Hollington, and Bank House stone. The Derby-street elevation comprises a tower and spire (120 feet high) on the one side, and a porch on the other, forming the entrance to the church. A principal feature in this elevation is a large five-light window, filled with tracery in the head. This window is glazed in geometric patterns of stained glass, in lead quarries, by Mr. Wailes, of Newcastle-upon-Tyne. The other windows of the church are also by Mr. Wailes, but have stained borders only, excepting the tracery, which is filled with stained glass in geometric patterns. There are several other windows of minor interest. The side elevations are divided by buttresses into six bays, with a two-light traceried window in each. Under these, in what may be called the basement, are three-light windows, with tracery, lighting the school-room under the church. The floor of the church is raised about 4 feet 6 inches above the Derby-street level, and this, with the inclination or declivity of Russell-street, has enabled the architect to obtain a well-lighted room beneath the church, 12 feet 6 inches high in the clear, entered by a trifling descent from the street level at the lower end of the building. This room is intended for a boys' Sunday-school and a general assembly-room, and will accommodate 500 or 600 persons. The porch and tower entrances have been brought nearly to the line of the street, and to avoid the inconvenience of entering the church direct from the street, the entrances are planned laterally from an open area between the porch and tower. A corridor and lobby, with panelled and glazed screen, with tracery, separate the church and entrances. The entire length of the church, within the walls, is 72 feet, and the width 34 feet; but, including an apse for organ and choir, the entire interior length is 85 feet. The apse is separated from the church by a high pointed and moulded arch, springing from carved stone corbels with shafts; and the ceiling is groined, with moulded ribs and arches, springing from moulded corbels. The hammer-beam roof of the church, the curved ribs of which, with tracery on the under-side, spring from moulded and carved stone corbels, covers the entire width in one span, and the spandrels of the same are filled with perforated tracery. The ceiling, slightly curvilinear in form, is brought down to the level of an elevated straining-beam, and is formed into panels by moulded ribs. The principal constructive timbers of the roof are exposed, and the ironwork is painted in colours. A moulded stringcourse runs round the walls in the interior. The pulpit, which is of oak, with carved enrichments and traceried panels, stands on one side of the choir-opening. In the apse will be placed a new organ, designed in keeping with the style of the church. The whole of the benches are open, of uniform character. The walls all round at the ends of the seats, are cased with deal, finished above the top of the seats with perforated tracery. A gallery, at one end of the church only, is approached by a stone staircase in the tower, but the general arrangements are such as to admit of side galleries, if required. At the rear of, and attached to the church, is the girls' school building, comprising, on the ground-floor, corridor, class-rooms, and Sunday infant-school; and, on the upper floor, a girls' school, extending over the whole. Between the schools and the church, over the turret stairs to the apse, is a spire, 66 feet high, with ornamental iron terminal, and covered with slate in coloured bands. The whole of the interior woodwork is stained and varnished. The church is lighted by coronæ, suspended from the roof. The spires are made available as outlets for vitiated air. The buildings are warmed by the apparatus of Messrs. Haden & Sons, of Trowbridge. Mr. Sugden, of Leek, was the architect, and under his direction and superintendence the works have been carried out by the following contractors, viz.:—The stonemasons' and bricklayers' work, by Mr. J. Naden; the carpenters' and joiners' work of the chapel, by Messrs. Nixon, and of the schools, by Messrs. Hudson; and the plumber, glazier, and painters' work, by Mr. Howard, all of Leek.

STAINED GLASS.

Pembury Church (*Kent*).—An east window, of stained glass, the gift of the Hon. Mrs. Shaw Stuart, has been put up in this church. The window was made by Mr. Gibbs, of London. It is divided into four compartments, and each compartment contains a good-sized picture. The subject is Martha and Mary; and accordingly, in the first light, there is "The anointing of our Lord's Feet by Mary." The two centre lights are, "Jesus weeping at the Tomb of Lazarus," and "Jesus raising Lazarus from the dead," whilst the fourth light shows "Mary sitting at the Feet of Jesus." At the foot of the window are eight angels, two in each light, holding texts.

Claines Church (*Worcestershire*). — In this church, at the east end of the north aisle of the chancel, some stained glass, by Messrs. Clayton & Bell, is inserted in a three-light Perpendicular window, and contains in the centre light "St. John writing on a Book," and a scroll running across the window with the inscription "Blessed are the dead which die in the Lord; even so saith the Spirit, for they rest from their labours." In the left-hand light is St. John leading Mary, the mother of the Saviour, from the cross; and on the right, St. John and St. Peter at the sepulchre. Above are angels, with scrolls, and the inscription, "He is not here; He is risen." Between the mullions of the head tracery are the sacred monogram, the Alpha and Omega, &c. This window was erected in memory of a husband by his widow.

Barbourne.—At St. Stephen's Church, Barbourne, the west window has recently been filled with stained glass, designed and executed by Mr. Preedy. The four lights contain six subjects, in two tiers, representing events in the life of St. Stephen: his Ordination as a Deacon; Speaking before the Council; Distributing Alms to the Widows; Laying his Clothes at the Feet of Saul; his Stoning; and being carried to his Burial. The second and fifth subjects occupy the two centre lights, the others being confined to the width of one light. The large circle in the traceried head of the window contains a half-length standing figure of Our Lord, His right hand raised in benediction; while each of the two smaller circles has the figure of an angel.

Salwarpe Church (*Worcestershire*). — In Salwarpe Church, two stained-glass windows have been recently put into the chancel. Both have been executed by Messrs. J. Hardman & Co., of Birmingham. The one which is in the north side of the chancel is a memorial window to the Rev. J. V. Vashon, and Mary Anne his wife, afterwards Mrs. Hastings, and the subjects are, "The Good Shepherd," and "Our Lord bearing His Cross." The other is the east window, consisting of four lights, and is a memorial of the Rev. Robert Douglas, Frances his wife, and their eldest son, the Rev. Henry Douglas. The subjects are, "The Crucifixion," and "The Descent from the Cross."

Kildwick Church, Craven, Yorkshire.—A stained-glass memorial window has just been erected in this church by Mr. Thomas Bairstow, Royd Hill, Sutton. The window is a three-light. In the left-hand one is represented "Elijah restoring the Widow's Son;" in the centre is Christ as the Good Shepherd; in the right-hand light is "Timothy receiving Instruction from his Mother and Grandmother." The subjects are surmounted by foliated canopies. The spaces above are filled in with diaper-work. Messrs. Ward & Hughes were the artists.

PROVINCIAL NEWS.

Faversham (*Kent*).—The new almshouses at Faversham, recently erected on the site of the town Orchard, are now completed. They comprise thirty almshouses, with a chapel in the centre. The frontage towards Ospringe-road is about 470 feet. The return wings respectively facing Tanner-street and South House have a depth of 120 feet. The site, comprising about 2½ acres, is surrounded by a fence, composed of brick, stone, and iron. Each almshouse contains an entrance passage, a living-room, kitchen, pantry, and out-buildings. On the upper floor are two bedrooms, closet, &c. In the rear of the houses are small yards, one yard being common to two houses, and separated from the others by the out-buildings attached to each almshouse. The arcade, or covered way, which continues throughout the whole line of frontage, is supported by cast-iron columns, each having a carved stone cap, annulet of iron, and moulded stone base. The floor of covered way is paved with red and blue Staffordshire tiles, laid to a pattern, the roof being covered with slates, the timber stained and varnished, and plastered between. At the extreme end of the covered ways in the main elevation, facing Ospringe-road, stand the water towers: in each tower is a cistern, from which the whole of the houses are supplied. These towers are furnished with a spire, constructed with timber, and covered with tiles, terminating with wrought-iron ornamental finials. Exteriorly the buildings are of red brick, relieved by white brick bands. All the window arches, and the dressings generally, are of Bath stone, from the Box quarries. The roofs generally are covered with plain tiles, and are of high pitch. In the centre of the structure, and conspicuous by its height and general appearance, stands the chapel, built of stone. The entrances to it are on the north and south sides; and, beneath, are octagonal turrets, rising 80 feet in height. The covered ways lead direct into the chapel, so that the inmates may attend Divine service without inconvenience in case of inclement weather. The dimensions of the chapel are as follows: total length, from east to west, 80 feet; width, 24 feet; width of each aisle, 8 feet; the height to wall plate, 30 feet; and total height to ridge of roof, 54 feet. The chapel is apsidal, the apse being pentagonal. The style selected has been that which prevailed during the latter part of the thirteenth and beginning of the fourteenth century.

Dudley.—The new Mechanics' Institution has been formally opened by Earl Dudley, in the presence of a crowded and influential assembly, and the occasion was observed as one of general rejoicing. The structure is from designs by Mr. W. Bourne, of Dudley, architect; and the builder was Mr. Millward, of the same place. It is of Italian palatial architecture, and is fronted with stone. It contains a museum, minor lecture-rooms, a class-room, a library, a large public hall, and other accommodation.

Bristol.—At a recent meeting of the town-council, Mr. Warren proposed a resolution to the effect that it was desirable to cover the quadrangle of the Corn Exchange. Plans, he said, for the alteration were prepared some time since; one for merely covering over the area, and the other for including the whole of the building, and making a spacious hall capable of holding 3,000 persons. He wished the plan to be submitted to the finance committee, who should bring up the report. A long discussion took place upon the subject, and ultimately Mr. Warren's motion was altered, referring the matter to the finance committee, requesting them to examine the existing plans, inquire into the matter, and report to the council.

Cottingley.—For two or three years past a number of gentlemen in the neighbourhood of Cottingley have been anxious for the erection of a building at this village, for the various purposes of a day and Sunday school, a lecture-room, and a place of worship for all sections of

the Protestant church. The foundation-stone of such a building has just been made by Mr. W. E. Glyde, of Saltaire. The ground on which it is to be raised has been given to the inhabitants by Mr. W. Ferrand, M.P. It will be erected in the Italian style of architecture, from designs by Mr. S. Jackson, of Bradford. On the basement floor there will be a school-room, and over that a large lecture-hall. At each side of the entrance will be a class-room. The lecture-room will be furnished with a gallery, which will extend over the entrance and the class-rooms. An apparatus will be provided for heating purposes. The building will cost over 1,000*l.*, and towards that sum about 850*l.* have already been promised.

WATER IN LONDON AND GLASGOW.

YOUR correspondent "Anti-Monopoly," in a late number, whilst advocating the supply of water to London by gravitation, gives some interesting information concerning the aqueducts of ancient Rome, and also as to the mode of supply recently carried out in several cities in Europe and America.

As an additional argument, he might have cited the case of the Glasgow Corporation water supply, which will bear comparison with any similar work.

It is unnecessary to give many details of this work, as it has been described in your pages. I may, however, repeat, that the storage is about 160,000,000 of cubic feet, chiefly obtained by raising Loch Katrine and Loch Vennachar. The aqueduct from Loch Katrine to the receiving reservoir, is about 27 miles in length, which for upwards of half this distance consists of a series of tunnels, cut through the hardest description of rocks. From the receiving reservoir the water is conveyed to the city, by means of several lines of pipes, each 3 feet diameter. The aqueduct is capable of delivering 50,000,000 gallons per day, when the wants of the city shall require this quantity.

The cost of the works has been about 750,000*l.*, but including the purchase of the works of the former water company, water privileges, and other expenses, the total cost to the city has been upwards of 1,500,000*l.* If London were to expend ten times this sum in obtaining a similar boon, the sacrifice would not be greater than in the case of Glasgow, regard being had as well to the relative wealth as to the population.

SCOTIA.

ARCHITECTS IN STOCKPORT.

SIR,—A few weeks ago a "Stocktonian" complained in your pages of their great want of an architect. I think, however, the "Stockportonians" feel the want in a still greater degree. The only representatives of the architectural profession in Stockport, a town of 60,000 inhabitants, are a firm who advertise themselves as "Builders, Timber-dealers, Surveyors, Valuers, and Architects," and their place of business is a saw mill.

Surely there is an opening here for an architect. During the last three years there have been four churches erected, and others restored, and more than a hundred houses (I mean good houses, not cottages).

A STOCKPORT COTTON SPINNER.

ACOUSTIC POTTERY.

YOUR correspondent, "Mr. F. G. Stephens," is quite in error in supposing that the chambers and vases at St. Peter's Mancroft Church, Norwich, are of the period of Sir Thomas Brown. He died in 1682, and his work called "Hydriotaphia; or, a Discourse on Urn Burial," was published in 1658. Now, there were very clear indications that the walls of the chambers into which the vases were built were of the same date as the church, which was finished and consecrated in 1455, or 200 years before Sir Thomas Brown wrote his book; and the stalls and flooring which covered the chambers (two or three of the former are still existing) were certainly of the middle of the fifteenth century. Besides, why should the arms appear again, precisely similarly arranged, at St. Peter's Mountergate, with which the worthy knight, so far as is known, had no connexion?

I would take this opportunity of correcting an error in my last. Instead of the chambers being about 1 foot wide by 1 foot 6 inches deep, I should have written, about 2 feet wide and 2 feet 6 inches deep.

MARLWAINE PHIPSON.

PROCEEDINGS UNDER THE METROPOLITAN BUILDING ACT.

Open Shed Buildings. At the Wandsworth Police Court, on the 29th ult., Mr. Norris, junior, builder, of Tooting, appeared before Mr. Ingham to a summons taken out by the District Surveyor of Wandsworth, Mr. Hiscocks, for non-compliance with the rules of the said Act, viz., 1st schedule, "That every building shall be enclosed with walls constructed of brick, stone, or other hard and incombustible substances;" and section 27, rule 1, "Every building shall be separated by external or party walls from any adjoining building."

The defendant had erected on the Christ Church estate, at Tooting, an open shed, about 70 feet long, 9 feet high, and 7 feet wide, extending over certain detached buildings recently erected by him, and abutting on wooden buildings of an adjoining owner, Mr. Hooper, and he contended that the shed complained of was not a building.

Mr. Ingham observed that there was no definition of the word building in the Act

The District Surveyor contended that "All new buildings," section 7, included all buildings of what nature soever, and that the word building was no doubt left undefined to avoid difficulties that might otherwise arise in attempting a definition; and that if this was not a building, then the defendant could, if he had so chosen, have covered the roof with thatch instead of tiling, and then it would be contrary to section 19, as to roof coverings: this, he thought, proved that it was a building.

Mr. Ingham then urged the necessity of seeing that the rules of the Act should be carried out. Mr. Hiscocks frequently brought before him difficult points for decision; but in this case there could not be any doubt as to what should be done; and he therefore ordered that the work should be amended or demolished: the costs to be paid by the defendant.

Books Received.

The Ghost! as produced in the Spectre Drama. By HENRY DIRCKS, C.E., the Inventor. London: Spon, Bucklersbury. 1863.

ALTHOUGH this volume gives an account of the "Dircksian Phantasmagoria," growing out of the paper read to the British Association for Science in 1858, with a description of the patented arrangements, and suggests fresh subjects, the real object of it is obviously to show that the inventor has been very badly treated by the directors of the Polytechnic Institution. What he complains of is, and it certainly seems reasonable enough, that having given them his invention *free*, desiring only a full and fair acknowledgment of his name as the inventor, he has had the greatest difficulty in forcing them to spread abroad his name in connexion with it. This, if correct, was surely most ungenerous. The course is apparently not persisted in, as we perceive his name now in all their advertisements, and we have no doubt the directors are busily considering the best shape in which they can present to Mr. Dircks some magnificent acknowledgment of the great service his invention has been to them.

VARIORUM.

The Railway News and Joint-Stock Journal, of which the first number has been published, proposes to take higher literary ground than is at present occupied by the Railway Press; whether it can do so or not remains to be seen. Amongst the articles in the first number is one opening the question of "Railway Rating," an important matter. It has latterly been stated elsewhere that the London and Brighton Railway, which is largely a suburban railway, and which also contributes largely to the rates in Brighton, where the taxes are heavy, pays 155*l.* 15s. per mile per annum. The North London pays 281*l.* 9s., a very heavy rateal, but nothing to equal that of the Blackwall line, for which the company pays in rates and taxes not less than 4,073*l.* per annum, or 815*l.* 12s. for each mile of its length. The writer of the article in the *Railway News* says the total amount of local rates and taxes paid by the railway companies of the United Kingdom was in 1862, 596,410*l.*, or at the rate of about 4¼ *per cent.* on the gross traffic-receipts. The London and North-Western Company alone pay upwards of 85,000*l.* a year.——A newspaper devoted to telegraphy has been started under the title of the *Telegraphic Journal*, a weekly record of electrical progress.——*Fraser's Magazine* contains an article on "The Royal Academy Commission," the writer of which demurs to the continuance of the Academy "in the exercise of its three several functions, as dispenser of honours, art teacher, and exhibition proprietor," as inconsistent with the true interests and becoming position of art in this country. He would restrict the Academy to the first, and would have the means of exhibition and fine art-schools established and maintained by the State.——*The Social Science Review, and Journal of the Sciences*, now takes a book shape, and is edited by Dr. B. W. Richardson. It will be issued monthly. The editor commences an interesting subject, "The Diseases of Overworked Men."——The January number of the *Churchmen's Family Magazine* contains some pleasant reading and illustrations.——Mr. E. Stanford (Charing-cross) is re-issuing the "Useful Knowledge Society's Family Atlas," with all the latest corrections and additions. The maps are beautifully printed on good paper, and have a "thumb index" to facilitate reference to them. The publication will include 80 maps in 20 half-crown parts.——Under the title of "The Brown Book," Saunders & Otley have issued the first half-yearly specimen of a guide intended to supply several wants: to show the nearest post-office, telegraph-office, fire-engine, cab-stand, and so forth, to any given street; list of lodgings, the various societies, theatres, &c., &c. Why are the artistical exhibitions and societies left out?——The *Art Journal*, edited by its originator, Mr. S. C. Hall, commences the new year with renewed vigour, and promises a number of engravings from the works of Turner and from paintings by E. M. Ward, O'Neill, Frith, F. R. Pickersgill, Dyckmans, and others. Mr. Dafforne will continue his notices of the works of British artists, and Mr. Thomas Wright, Mr. I. B. Pyne, Mr. Llewellynn Jewitt, and other writers, will contribute articles. The January number is a good one.

Miscellanea.

ARCHITECTURE AT THE ROYAL ACADEMY.—Professor Smirke delivered the first lecture of his course on Thursday evening. We shall return to it. The second lecture will be given on the 14th inst.

QUARTERS FOR MARRIED SOLDIERS AT CANTERBURY.—The new quarters for married soldiers at the Canterbury Barracks, which have been erected at a cost of nearly 10,000*l.*, including extras, are now ready for occupation. They have been built by Messrs. Cozens Brothers, and their erection has occupied about twelve months. There are four blocks of residences, each containing twenty rooms, ten on the basement and ten on the upper story. The entrances to the latter are by verandahs with open iron staircases at the ends. Each room is about 18 feet by 16 feet, and is fitted up with oven and boiler, cupboard and shelves, gas, &c.

GREAT IMPROVEMENTS AT CARDIFF. — The guardians of the Marquis of Bute are about to lay out nearly two millions sterling in making new docks at Cardiff. The marquis already owns two docks there, each about a mile long, and vessels are lying in them six and eight deep. He is lord of the manor of the country round Cardiff. In his father's time this property was valueless,—it would not even feed sheep; but steam coal mines were discovered there, which have proved to be of enormous value. The royalty of these mines and the dock revenue bring in a princely income. The marquis's waterside property was given to his father by the town for the purpose of making docks.

CLAIM AGAINST THE METROPOLITAN RAILWAY COMPANY.—At the Sheriffs' Court a claim for compensation was made in the case of Madame André *v.* The Metropolitan Railway Company, for 4,790*l.*, for the loss of the business of a chiropodist, in the Marylebone-road, through the obstructions caused by the works of the Underground Railway. According to the evidence of the claimant, she made 15*l.* a week, in the season of four months, by corn-cutting, and averaged 8*l.* a week for the remainder of the year. For two years and more the works of the company had obstructed her business, and prevented her carriage people coming to her house. She, in consequence, became bankrupt. After some proceedings, the jury assessed the damages at 850*l.*

THE MANUFACTURING DISTRICTS.—At the last meeting of the Relief Committee, in the Town-hall, Manchester, Mr. Rawlinson read a statement, in which he said,—"There are at present forty-nine (places) cities, towns, and districts, in which the Public Works Act is in operation, representing upwards of 1,000,000 of population. The Public Works Act became law at the end of July, 1863. My first report to the Poor-law Board, on works, was made on the 13th August, 1863 (Blackburn), for 78,300*l.* Since that time I have examined sites of proposed works, and have prepared and forwarded some seventy reports, recommending estimates for sanction amounting to nearly 1,200,000*l.* The Poor-law Board have prepared and issued fifty-one orders, for sums amounting in the whole to about 620,000*l.*; first and second instalments, amounting to 265,306*l.*, having been sanctioned; other orders are in progress. There are at present about 2,000 men at work under the Public Works Act; but this number is increasing. The action of the Public Works Act is in every respect permissive. Its adoption and its execution depend on the local authorities. The works proposed to be executed must be of a beneficial character."

PROPOSED PURCHASE OF THE "GREAT EASTERN."—The arrangements for the purchase of the Big Ship by lottery are going on. There are to be 240,000 subscriptions of 1*l.* each, 200 of which will gain prizes of shares in the ship ranging from 40,000*l.* to 19,500*l.* each. The drawing is to take place in Frankfort, should nothing adverse occur.

THE PROPOSED ALBERT WING AT THE BATH UNITED HOSPITAL.—A deputation from the Albert Memorial Committee has waited upon the Borough Property Committee to request them to surrender the fee simple of the land belonging to the corporation, upon which it is proposed to erect the new wing, offering the sum of 2,000*l.* for the same. The committee expressed their hearty concurrence with the wishes of the deputation, and unanimously passed a resolution to submit the matter to the town council, at the same time asking the consent of the Lords of the Treasury to the transaction, without the sanction of whom they cannot act.

DINING-HALL FOR THE LIVERPOOL DOCK WORKMEN.—Great inconvenience having been experienced by the workmen employed by the Dock Board, mostly living at such distances from their work that they cannot get comfortable dinners, the Board has established a dining-hall, where well-cooked dinners will be provided at the lowest possible charges, and the men will enjoy a cleanliness and comfort which will be new to many. The hall, which is rectangular in shape, has been built on some spare land adjoining the dockyard and fronting the river. It is divided into an upper and a lower compartment, each of which is 100 feet long, 15½ feet wide, and about 10 feet in height. It is well lighted by windows facing the river, and is supplied with everything that can enhance the comfort of the workmen. The management of the hall will be thrown as much as possible into the hands of the men themselves. The rooms will accommodate 500. The men bring their own provisions, and cook and eat them in the hall.

ARTESIAN WELL AT SHEERNESS. Water has been found in boring the new well of the Board of Health at the depth of 310 feet below the surface. At seven o'clock a.m., on the 22nd ult., the water had risen 237 feet in the well, or to within 103 feet of the surface. During that day (Tuesday) it rose another 17 feet. At noon on Wednesday there was found to be 272 feet of water in the well, and it was still rising. The water-bearing strata now reached are of the same nature as those found in the dockyard well at 352 feet below the surface, and were there found to be 15 feet thick. The yield of water, however, was not thought to be sufficient; and it is understood that the Admiralty authorities have entered into an agreement with Mr. Tilley to sink their well deeper. The contract of Mr. Tilley with the Board of Health requires him yet to bore 40 feet, should it be found necessary. The yield of water for the first 237 feet was at the rate of 2,290 gallons per hour; but later in the week, with a head of 237 feet on the spring, it yielded water at the rate of 295 gallons per hour.

THE DWELLINGS OF THE POOR.—A meeting of gentlemen interested in the formation of a company or association for improving the dwellings of the poor in Norwich, has been held at the Guildhall in that city; the mayor in the chair. After some preliminary discussion, in the course of which several speakers expressed their opinion that the object of the proposed society should be to buy up and improve old dilapidated and ruinous dwellings, the Bishop of Norwich said the first practical step would be to form an association and define the object it had in view, what amount of capital would be required, and the amount of shares in which that capital should be taken. He thought that the object of the association should be threefold; viz., the improvement of the dwellings of the better class of the poor, then the improvement of the dwellings of the very poor, and the establishment of lodgings for single men. He moved that a company be formed for the improvement of the dwellings of the labouring classes in Norwich and its vicinity. Some discussion ensued as to the desirability of calling the proposed body a "company" or an "association," but a decision was eventually arrived at in favour of the former designation. The resolution of the Bishop was carried unanimously. Sir J. P. Boileau remarked that the object of the company was experimental: if it were successful, more speculative persons would take the matter up commercially.

GROCERS' ASSISTANTS.—A new Friendly Society has been started, to meet the wants of that numerous body the grocers' assistants, and for the mutual advantage of employer and employed. The movement is well supported by the leading houses in the trade.

BRONZING. The Chinese are said to bronze their copper vessels by taking 2 ounces of verdigris, 2 ounces of cinnamon, 5 ounces of sal-ammoniac, and 5 ounces of alum, all in powder, making these into a paste with vinegar, and spreading it upon the surface of the article, which should be previously brightened. The article is then held over a fire till it becomes uniformly heated; then it is cooled, washed and dried. It thus receives one, two, or several of such coats until the desired colour is obtained. An addition of sulphate of copper to the mixture makes the colour chestnut-brown.

RECIPE FOR A HAPPY HOME.—We have somewhere met with this assertion, which seems worth repeating:—"Six things are requisite to create a happy home. Integrity must be the architect, and tidiness the upholsterer. It must be warmed by affection, lightened up with cheerfulness, and industry must be the ventilator, renewing the atmosphere and bringing in fresh salubrity day by day; while over all, as a protecting canopy and glory, nothing will suffice except the blessing of God."

THE MARSHLAND SMELTH AND FEN DRAINAGE. The works of diverting the course of the Marshland Smeeth and Fen drain, and erecting a new outfall sluice, are being pushed on rapidly by the contractor, Mr. W. D. Harding. Although the works have been but recently commenced, the progress made is very apparent. The present position of the works is somewhat as follows: The dam constructed after much time and at great expense by Mr. Page at the mouth of the drain has been all removed, or nearly so, and a portion of the old sluicework also. A few yards higher up the drain, Mr. Harding constructed, an earth dam, which has been flanked with banks to render the country safe from the sea water. The roadway across the drain over the old sluice will be soon completed, and a permanent blocking up of the old mouth of the drain be thus effected. The excavation for the new course of the drain has already been cut to the depth of some feet

THE FEVER DENS OF ISLINGTON.—The owner of premises in Brand-street, Islington, was summoned before Mr. D'Eyncourt, at the instance of the vestry of St. Mary, Islington, to answer a complaint under the Nuisances Removal Act, to the effect, that the said premises were in such a state as to be a nuisance and injurious to health, and unfit for human habitation. Mr. Layton, the vestry clerk, stated that the defendant was the owner of four small washhouses, cottages the defendant called them, which were occupied as dwellings. When they were built they were never intended for human habitation. These places were in a filthy condition, and improperly ventilated, having no back windows. There was only one closet for the use of the occupants of the eight houses. The yard was also unpaved; there was no dust-bin, and two of the waterbutts were rotten. In addition the places were very damp, and were quite unfit for human habitations. One of the cottages was occupied by four persons, and as the entire area of each house was only 708 feet 9 inches, there was only 177 feet of air to each person. The defendant said the houses were his, and no one could do more than he did to keep them clean, for every morning he threw water down the drains. As for the houses being damp, that could not be, as he had composed them. Dr. Ballard, medical officer of health, said the places were unfit for families to reside in, and there was no through ventilation: they were in a filthy condition. Mr. D'Eyncourt made an order for the houses to be properly ventilated, and also that other work required should be done. An owner of premises in Graham-street was summoned for a like offence. Mr. Layton said that the state of one of the houses would show pretty nearly the state of the whole of the others. At No. 3, the house was in a bad state of repair, and very filthy, the paving also being defective: the drain, owing to its being made of brick, and not having a proper fall, was offensive. There were no dust-bins to any of the houses, and the yards were very dirty. The waterbutt was rotten, and not covered, and had no tap or ball-cock, and the tenants had to dip the water. Mr. D'Eyncourt made an order for the immediate doing of the necessary work, and ordered costs.

THE LATE MR. J. J. SCOLES, ARCHITECT.—We notice, with regret, the death of Mr. Scoles, on the 29th ultimo, at his residence, Crofton Lodge, Hammersmith. On another occasion we will give some account of his professional career.

LIVERPOOL ARCHITECTURAL SOCIETY. — On Wednesday night, the 30th ult., the fortnightly meeting of this society was held at the Royal Institution, Mr. W. H. Weightman, the president, in the chair. Mr. Frank Howard read a paper on "Fresco-Painting and its Substitutes."

COCKERMOUTH AND THE LOCAL GOVERNMENT ACT. An order, signed by Sir George Grey, has appeared in the *London Gazette*, ordering that the Local Government Act, 1858, shall henceforth have the force of law within the township. A vestry meeting will decide as to what number of members shall constitute the local board.

THE CANADIAN OIL-WELLS.—It appears that from most of the principal wells in Canada the oil has ceased flowing and cannot be obtained without machinery by the expensive process of pumping. In Pennsylvania the cost of pumping has been encountered, but the oil obtained there is much superior in quality to that of Canada.

THE ARCHITECTURAL MUSEUM: COLOUR PRIZES. It may be useful to mention that this competition remains open until March 1st, and that casts for coloration may now be had by letter to the honorary secretary, enclosing a post-office order on Charing-cross for 5*s.*, or for 7*s.* if case and packing be required. The subject selected is the "Miserere," which obtained the second prize in the recent wood-carving competition, "The Gleaners," which has already received our commendation. The prizes offered are 5*l.* 5*s.* and 3*l.* 3*s.*, with extra prizes for deserving specimens.

THE COPPER TRADE.—Copper is advancing in price, and the demand for it is increasing in a greater ratio than the supply. A company, of which Mr. Pender, M.P., is one of the directors, has been formed to increase the supply by undertaking to buy and to work the Panuncillo Mine, in the province of Ovalle, in Chili. This district, it is said, contains some of the richest mines in South America; and the Panuncillo alone produces more ore than any mine in the world, not excepting the Devon Great Consols. In the two principal workings the lode of clean ore is 60 feet wide, and worked horizontally and cheaply. The extent of the lodes is practically inexhaustible. The capital of the company is 200,000*l.*, in 4*l.* shares.

VENTILATING LONG LEVELS. In the Latrobe tunnel, in Virginia city, Nevada territory, a mode of ventilation, said to have been in use amongst the ancient Germans, has been introduced. It is reported that when the tunnel was in only a few hundred feet, an air-shaft had to be sunk, and at about the same distance further another was put in: at this point the bottom of the shaft was closed up, except a hole about 10 inches square, through which passed a wooden box flume of that size, by which the air is conducted into the further extremity of the tunnel. The draft is so strong that no other shaft has yet become necessary. The tunnel is now about 2,600 feet. The Santa Fe Mine has adopted a similar system of ventilation.

THE NEW GYMNASIUM AT CHATHAM. — This building is now completed. It is said to be the most complete of the eight which have been constructed for Government by Mr. A. Maclaren, of Oxford. The main structure consists of two large divisions, each in the present instance 100 feet in length by 50 feet in breadth. The primary object of this form of building is to insure perfect supervision and inspection, every portion of either part being overlooked from the other. The first division consists of the school of arms. The second division includes the gymnasium proper, and is appropriated for every variety of exercises with the fixed apparatus comprised in the system. In this department the floor is formed of a soft elastic substance, so that from whatever height a fall should occur, comparatively little injury would be the result. A lofty lantern tower which surmounts one portion of the building has been appropriated for the apparatus for high climbing, and these being placed vertically, are closely grouped together. The lower end of the school of arms terminates in a series of rooms, including the officers' fencing-room, instructors' rooms, dressing-rooms, &c. The officers' fencing-school is itself the largest building of the kind yet erected, being 50 feet in length by 25 feet in breadth. Ample arrangements are made for light and ventilation.

ANCIENT RELICS FOUND NEAR NEWSTEAD ABBEY.—There have just been discovered some very interesting relics near to Newstead Abbey, Notts (the seat of the late Lord Byron). They were found by labourers employed in making a new carriage-drive in the park. The relics consist of a portion of a statue, representing a warrior in the time of Henry III., as exhibited in the chain mail of that period; an ancient freestone floor, probably part of an ambulatory; a great quantity of window tracing of the fourteenth century, and some small jamb shafts of the thirteenth century.

FROM SCOTLAND.—The Trinity (United Presbyterian) Church was opened on the 29th of December. The edifice is built after the designs of Mr. F. T. Pilkinton, of Edinburgh, architect. It possesses many features; among others, the absence of mouldings, which are supplied by carvings of natural foliage, arranged by Mr. Henry Weekes, of London. There are two stained-glass windows by Messrs. Field & Allen. The plan of the building is fan-shaped, and it is seated for 800. The front view would be very monotonous without the breaking up, or relief, given in colour. Blue limestone, with white sandstone and red occasionally, are the chief materials. The estimated cost was 3,500*l.*: actual cost was 4,600*l.*, owing to a bad foundation. The builder was Mr. H. Wright, of Irvine. The building has an open timber roof, supported upon four columns carved with emblems of Virtue, Baptism, Marriage, and Eternity.——The New National Bank Building is now fully completed, from the design of the architect, Mr. David Macgibbon, of Edinburgh.

ACCIDENTS.—A warehouse at Wisbeach, used for many years for bar iron, being loaded with nearly 800 quarters of barley, gave way and fell out into an adjoining yard, injuring a man, but not seriously.——An inquest has been held on the body of a workman, who fell from a scaffold at the new hotel buildings, Brighton. A fellow-workman stated that deceased was a bricklayer, and at the time of the accident he was engaged in cutting bricks. One of his feet was standing upon a brick, and as he was in the act of turning his body round to place a trowel of bricks on the scaffold, his foot slipped, and, overbalancing himself, he fell off the scaffold to the ground. The scaffold was about 4 feet wide. A verdict of accidental death was returned.——The new culvert at Grimsby, has been partly destroyed. It appears, that the watchman whose duty it was to look after the works had been discharged by Mr. Clarborough; and some obstruction having hindered the flood-gates from closing, the tide rushed into the culvert, and the hydraulic pressure completely forced the upper portion from its bed. This casualty will entail a loss on the contractor, and it is said to be not altogether certain that it was accidental.

PRIZES TO THE EXHIBITORS OF THE "SOCIÉTÉ DES BEAUX-ARTS APPLIQUÉS À L'INDUSTRIE," PARIS.—On the occasion when these prizes were given, M. Guichard briefly alluded to the medals presented by the Emperor and Empress, and then proceeded to explain how this exhibition should not be confounded with the industrial exhibitions hitherto held. The juries of the latter were pre-occupied with numerous important considerations entirely independent of art. Beauty of form, happy harmony of colour, clever execution,—in fact, art was shown by him to be the data on which the jurors of this exhibition based their verdict. M. Guichard terminated his speech with an announcement of the financial results. The receipts amounted to 77,000 francs, the expenses were about 45,000 francs, and a fund, founded by Baron Taylor, for the assistance of inventors and industrial artists, was about 32,000 francs. M. Guichard's address was followed by one from M. Tresca, who said in the course of it,—"The jury is divided into several sections, each of which presents a report. The section for painting have most particularly accepted the task of appreciating original works, due either to the pencils or to the brushes of our industrial artists. The section for engraving have included under their task the necessity of examining every species of reproduction, whether by lithography or photography. Our engravers on wood have no further cause to be envious of foreigners. Our litho-chromes and printings in colour hold good comparison with those of England. M. Rohault de Fleury has preceded his report on sculpture by an attempt to re-establish the true rules of good taste, and by warning artists against a too great abundance and richness in details."

WEEKLY TRAFFIC RETURNS.—The traffic returns of railways in the United Kingdom for the week ending 26th December, 1863, show on the twelve principal lines having termini in London an aggregate receipt of 356,035*l.*, the corresponding week of 1862 being 311,017*l.*; increase, 45,028*l.* The mileage for these lines was in 1863, 4,651¼; in 1862, 4,549; increase, 102¼ miles.

THE RAISING OF THE FLEET VALLEY.—With reference to a letter signed "Too Late" in a recent Number, Messrs. J. S. Atkinson, Raphael Brandon, and H. G. Freshwater have sent us a communication pointing to a design by them exhibited in Guildhall, which contemplated raising the surfaces, as urged by "Too Late." Another Competitor writes us to the same effect; but we cannot find space for the letters.

RAILWAYS FOR CHILI, IN SOUTH AMERICA.—A letter from Valparaiso, in a New York paper, says that "the contractor and capitalist, Mr. Brassey, who has constructed nearly all the railways in Spain and India, has sent an agent to Chili—a Mr. Bayles—with instructions to tender for all the railways the Government of Chili may desire to contract for, and guarantees an interest of 6 per cent. per annum on all the capital invested."

TENDERS.

For parochial schools and master's house, Chelsfield, Kent. Mr. Joseph Clarke, F.S.A., architect:—

Green	£953	0	0
Maers	927	0	0
Townsend	908	0	0
Francis & Son	807	0	0
Marsland & Son (accepted)	780	0	0

For residence at Addiscombe. Mr. J. F. Matthews, architect, Reigate. Quantities not supplied:—

Fieldwick	£885	0	0
Soden	829	10	0
Shilton	789	12	0
Dunk	777	0	0
Cook	722	0	0
Wesley	700	0	0
Wilson & Raynham	614	0	0
Drake	558	12	6

For the erection of Congregational chapel and school-room, Henham, Essex. Mr. Jasper Cowell, architect. Quantities supplied:

Savell	£1,375	0	0
Cole	1,470	0	0
Wheen	1,376	0	0
Burton	1,320	0	0
Glasscock	1,285	0	0
Glen (Brothers)	1,255	0	0
Thoday & Clayton (accepted)	1,246	0	0

For two masters' boarding-houses, Malvern, for the Malvern College Building Company. Mr. Charles F. Hanson, architect. Quantities supplied by Mr. J. A. Clark, Bristol:—

	House A.	House B.	Total.
Allen	—	—	9,130
Osborne	4,509	4,510	9,109
Smart & Son	—	—	8,888
Griffiths	4,237	4,122	8,359
M'Cann & Everall	—	—	7,984
Wood & Son	—	—	7,841
Jones & Son	—	—	7,790
Warburton, Brothers	3,743	3,642	7,385
Edwards	3,590		
Beavers & Son	3,514		
Wilson	3,370		
Field	3,277		

For the erection of a cigar manufactory and warehouse in Commercial-street, Whitechapel, for Mr. G. Phillips. Messrs. Hammack & Lambert, architects:—

Ennor	£3,875	0	0
Hedges	3,474	0	0
Gibson	3,370	0	0
Newman & Mann	3,342	0	0

TO CORRESPONDENTS.

OVENS AND FURNACES.—A correspondent asks for some particulars of the latest improvements in bakers' ovens and furnaces.

Ars jacutis, &c.—Messrs. B.—A. D.—J. E. (must condense).—J. D. W.—A Corporation Surveyor.—*Quocunque*.—T. L. D.—E. E. A.—C. C.—H. C. (we cannot advise as to safe investments).—Messrs. H. (thanks).—L. de V.—A Fifteen Years' Subscriber (write Atchley & Co., Great Russell-street).—J. C. M. (shall be referred to in our next paper on Condition of Buckinghamshire).—N. B.—T. L.—T. G.—J. F., Preston (apply to Weale).—R. P.—A. J. H.—O. P. Q. (a fee is due. Owner is liable).—Dr. M'C.—J. W.—M. J. L. (the *Builder* is published on Friday).—W. C. (light bridges over some of the London crossings have been often urged in our pages).—J. K.—W. D. H.—W. N. L.—S. C. R. (shall appear).

We are compelled to decline pointing out books and giving addresses.

All statements of facts, lists of tenders, &c., must be accompanied by the name and address of the sender; not necessarily for publication.

TO SUBSCRIBERS.

The TWENTY-FIRST VOLUME of "THE BUILDER" (bound), for the year 1863, will shortly be published, price One Guinea.

CLOTH CASES for binding the Numbers are NOW READY, price Two Shillings and Ninepence. It is necessary to state, when ordering these, whether the Advertisements are, or are not, to be bound with the Volume.

A COLOURED TITLE-PAGE can be had, Gratis.

SUBSCRIBERS' VOLUMES will be bound on being sent to the Office, at a cost of Four Shillings each.

This day is published, with Forty one Illustrations, in cloth boards, 5s.

ANOTHER BLOW FOR LIFE: an Exposition of the Condition of the People amidst Existing Frightful Evils, and Suggestions for their Safety.
By GEORGE GODWIN, F.R.S.
London: Wm. H. ALLEN, 13, Waterloo place, S.W.

[ADVERTISEMENTS.]

PEDESTAL HOT AIR STOVES.—A number of Pedestal Stoves, suitable for school-rooms, warehouses, churches, &c., manufactured by the late Mr. Pierce, to be sold at a low price. One Stove is of very large dimensions, and is entirely covered with majolica tiles. The Stoves will be sold separately, in perfect condition. They have all been removed from a public building where extensive alterations have taken place.—Apply to MESSRS. EDWARDS & SON, 49, Great Marlborough-street, Regent-street; or at their Factory, 86½, Oxford-street.

"OUT OF PRINT" is an expression almost as annoying to the public as it is to the publisher. Although some editions of Lett's Diaries are certainly scarce, yet it is believed that few, if any, are in this predicament; while at same time the gradations of size and form are so gentle as to render a temporary substitution unimportant. Sold by all Booksellers. Catalogues gratis.

PRIZE DESIGNS.—"As affording the most striking contrast, Mr. Benson shows with these a fresh exhibition of modern watches, with cases made from prize designs at the South Kensington Museum, some of which are fine specimens of engraving."—*Times*, Sept. 15, 1862. Chronometer, duplex, lever, horizontal, repeaters, centre seconds, keyless, split seconds, and every description of watch, adapted to all climates. Benson's Illustrated Pamphlet on watches (free by post for two stamps) contains a short history of watchmaking, with prices from 3 to 200 guineas each. It serves as a guide in the purchase of a watch, and enables those who live in any part of the world to select a watch, and have it sent safe by post. Prize Medal and Honourable mention, Classes 33 and 15.—J. W. Benson, 33 & 34, Ludgate-hill, London. Established 1749. Watch and Clock Maker by Special Warrant of Appointment to H.R.H. the Prince of Wales.

ADVERTISEMENTS.

The Publisher cannot be responsible for ORIGINAL TESTIMONIALS *left at the Office in reply to Advertisements, and strongly recommends that* COPIES ONLY *should be sent.*

Royal Insurance Company, 29, Lombard-street.

PUPIL WANTED, in an Architect's Office in London, where a large town and country practice is carried on. Premium, 150 guineas.—For address, apply to J. D. BROWN, Esq. Surveyor, 37, Great George-street, Westminster.

TO the Right Honourable the Lord Mayor, Aldermen, and Common Council of the City of London.

My Lord and Gentlemen,—

I beg leave respectfully to offer myself as a CANDIDATE for the vacant office of CITY SURVEYOR. Although I do not place my claims to your consideration upon any other basis than that of professional integrity and professional ability, I may be allowed perhaps to claim, through my late father, who, up to the time of his decease, eighteen years ago, was well known as a merchant of high standing, some connexion with the great trading interests of the City of London.

I shall have the honour of submitting to your notice testimonials of my competence to perform the duties of the office which I seek, and of personally soliciting your support.

In the mean time I may remark that in order to acquire a thorough practical knowledge of construction, I was articled to a first class London building firm, and subsequently entering the office of Mr Edward Lamond, the eminent architect, remained his principal assistant for nearly eight years, during which time I was actively engaged in numerous important valuations and negotiations relating to City property, and in all the other branches of one of the most varied and extensive practices in London; and for the last few years (during which I have been in independent practice) I have been enabled to apply the knowledge which I had previously obtained in such a manner as to secure the uniform approbation of my clients.

Should I be so far honoured with your confidence as to be elected to the office which I seek, I shall spare no exertions to discharge its onerous duties in so zealous a manner as to justify your choice.

I have the honour to be,
My Lord and Gentlemen,
Your most obedient Servant,
FREDERICK WALLEN.

68, Old Broad-street, December 3rd, 1863.

TO STONE AND MARBLE MASONS.

WANTED, for a permanency, a thoroughly experienced STONE and MARBLE MASON. He must have a good knowledge of cemetery work, and be a first-class letter-cutter and fix carver. VENTILATION—PURE AIR.

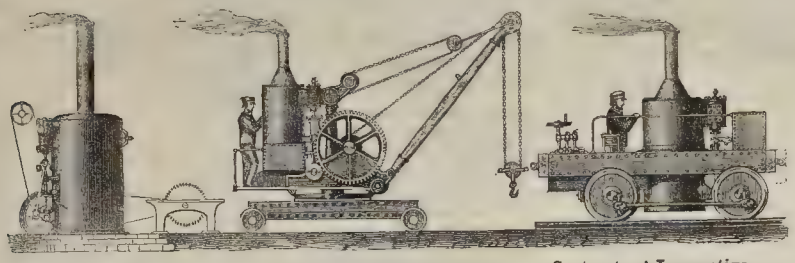
Sheringham's Day and Night Ventilator



for the admission of Pure Air.

THROUGH THE EXTERNAL WALL.

These Ventilators are arranged so that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required. HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street Borough, London.

CHAPLIN'S PATENT PORTABLE STEAM ENGINES AND BOILERS.

PRIZE MEDAL, INTERNATIONAL EXHIBITION, 1862.

Stationary Engine. From 1 to 30 Horse Power.

Portable Steam Crane. 1 to 30 Tons.

Contractors' Locomotive. 6 to 27 Horse Power.

From the strength, simplicity, and compactness of these Engines, they are now extensively used for general purposes; also in situations where eam Engines of the ordinary construction cannot be applied.

Stationary Engines.—require no building in, nor chimney stalk, and with our Patent forced combustion apparatus, will burn inferior qualities coal, wood, or peats. These Engines are specially suited for shipment, and may be packed inside the Boiler to economise freight.

Portable Steam Cranes,—for wharf or railway, with wrought-iron carriages on wheels, link motion, foot brake, &c., all under the easy ntrol of one man; the larger sizes hoist, lower, and turn round in either direction by steam.—*These Cranes were selected by H.M. Commissioners r receiving and sending away the heavy machinery at the International Exhibition of* 1862.

Contractors' Locomotives,—are adapted to work on rails or tramways of a gauge from two feet upwards; they are complete and efficient ocomotives, simple in construction, and the working parts easily got at for repair; they draw heavy loads at reduced speeds. These Engines are ually sent in one package, ready for work on arrival.

LIGHT PORTABLE, HOISTING, WINDING, AND PUMPING ENGINES, &c.

ALEXANDER CHAPLIN & CO. CRANSTONHILL ENGINE WORKS, GLASGOW.

OFFICE, 9, Adam Street, Adelphi, W.C.; LONDON DEPOT and WHARF, Lower Fore Street, Lambeth, S.

Engines of each class KEPT IN STOCK for SALE or HIRE, and all our Manufactures GUARANTEED as to EFFICIENCY, MATERIAL, and WORKMANSHIP.

Parties are cautioned against using or purchasing Imitations or Infringements of these Patent Manufactures.

RYFFEL'S PATENT HYGEIAN STOVE, heated either by coal or gas. With one pennyworth of coal this Stove affords for twenty-four hours a genial, healthy, and uniform temperature, free from any smell or decomposition of the air. It was favourably noticed in the "The Lancet" of February 1st, 1862, and recommended as the only stove particularly suitable for the bed or sick-room.—For particulars apply to the Depôt, where the Stove is sold, and may be seen in action.

RYFFEL BROTHERS,
5, Upper Stamford street, Blackfriars, London.

SMOKY CHIMNEYS.
WOOD'S
PATENT CHIMNEY-TOP

Is simple in construction and certain in effect. It has a good shape, is durable, and easily swept by the "sweeps" machine.
Price 30s.
Sent to all parts of the kingdom upon receipt of money order, addressed to the
PATENTEE, CAMDEN MANUFACTORY, CHISLEHURST, KENT.

DAVID JONES, Bridge Ironworks, and HERBERT'S Park Ironworks, Bilston, Staffordshire, Manufacturer, under licence of the Patentee of MALLET'S PATENT BUCKLED IRON PLATES, for flooring, for railway and other bridges, viaducts, wharfs, &c. and for flooring, and other parts of fire-proof buildings, and various important structural uses. These plates form the lightest, strongest, most rigid, and durable flooring known. They were pronounced by the late Mr. Brunel, "the best bridge flo ring extant." They have been adopted at the new bridge, Westminster, on the Indian railways, and in many other first-class structures, by Messrs. Page, Hawkshaw, Rendell, Stephenson, and other engineers, and for fire proof buildings by Government, the War Office, Metropolitan Board of Works, and other important uses. Specimens of the buckled Plates can be seen at Bull-wharf, Upper Thames-street, London.—Applications for lithograph circulars, prices, and other information, as to supply of the plates, to be made to the Manufacturer, as above; or to ROBERT MALLET, Esq. C.E. the Patentee, 11, Bridge-street, Westminster.

N.B.—Manufacturer of Boiler Plates, Bars, and Ship Plates; also Sheet Iron of all kinds, and Rivet Iron of first quality
Address, BRIDGE IRON WORKS, Bilston, Staffordshire.

ELIGIBLE FREEHOLD BUILDING LAND, in the CITY of OXFORD.—The Guardians of the Four of the Oxford Incorporation will offer for SALE, during the course of next Spring, the SITE of the present WORKHOUSE, in the City of Oxford, containing five acres or more. Further particulars may be obtained of W. JACOB, Clerk to the Guardians
Oxford, December 10th, 1863.

TO BUILDERS and OTHERS.—TO BE LET, several PLOTS of BUILDING LAND, situate in the best part of Stoke Newington, where houses are in great demand. Bricks supplied on the estate at a low price built may be raised on the ground for building purposes.—Apply to Mr. RODDA, at the Estate Office, Bouverie-road, Church street, Stoke Newington.

CITY of LONDON.—FREEHOLD.—FOR SALE, or TO BE LET, a valuable PLOT of LAND, partly built upon, containing 240 square feet, situate near Shoe lane. The above is well adapted for a printing office.—Inquire of Messrs. TATHAM & PROCTER, Solicitors, 36, Lincoln's inn-fields.

TOTHILL STREET, WESTMINSTER.—FREEHOLD.—FOR SALE, or TO BE LET, a Large PIECE of LAND, partly built upon, with frontage to Tothill street. The above is well adapted for the erection of a model lodging house for the poor, or for small tenements.—Inquire of Messrs. TATHAM & PROCTER, Solicitors 36, Lincoln's inn fields.

BUILDING GROUND TO BE LET, Broad street, Wapping, for a warehouse or five or six dwelling-houses, in a capital situation, adjoining the London Docks.—For particulars, apply to Mr. HERBERT WILLIAMS, Architect, 52, Old Broad-street, E.C.

PREMISES WANTED, for a HOME for LITTLE BOYS, with large garden or playground, on the north side of London.—Particulars and cards to view to be sent to Mr. A. O. CHARLES, 5, Ellington-street, Barnsbury, N.

A FREEHOLD MANSION TO BE SOLD. The elegant Furniture may be had at a valuation. There are four reception-rooms, two being 30 feet in length; eleven best bedrooms; stabling for eight horses and four carriages; suitable servants' offices; extensive ornamental grounds, with green-houses, in all 28 acres; gravelly soil; near Sunning hale station, south-Western Railway, half a mile from Windsor Great Park, and fifty minutes from the Waterloo Station.—Apply to J. MAY, Esq. Solicitor, 67, Russell-square.

NEAR the HOUSES of PARLIAMENT. TO BE LET, an UNFURNISHED HOUSE, suitable for offices. Apply on the Premises, 7, Millbank-street, S.W.

KEYNSHAM BLUE LIAS LIME and CEMENT WORKS, Somerset.—TO BE SOLD, by PRIVATE CONTRACT by order of the Liquidator, the newly-formed FREEHOLD WORKS, occupying a site of 7 acres, 2 roods, and 26 perches, or thereabouts. The existing kilns and ovens are capable of producing 700 to 800 tons of lime and 120 tons of cement weekly, both products being approved of by large contractors and eminent architects, the cement being used in many of the Government fortifications now in progress. The buildings are very substantial and the machinery is of the best description, driven principally by water-power, but with steam-power as auxiliary. Coals are supplied to the works at a very low price, and the Great Western Railway Station is within a short distance.—For further particulars, apply to Messrs. NICHOLINDO & SONS, Solicitors, 47a, Moorgate-street; to F. MAYNARD, Esq. Liquidator, 19, Bread-street, Cheapside; and to Messrs. FULLER & HORSEY, 13, Billiter-street, London.

FREEHOLD MILLS, with good Water-power, Keynsham, Somerset, well adapted for Corn Mills, Oil Mills, or Paper Mills, TO BE SOLD.—Apply to Messrs. FULLER & HORSEY, Billiter-street, London, E.C.

WATERSIDE PREMISES.—TO BE LET, on lease, a capital WHARF, having a frontage of 127 feet, to the City-road Basin. The building comprise counting-house, dwelling-house (containing four rooms), corn and chaff stores, stabling for 12 horses, with large yard and barge-yard adjoining, engine-house with chimney-shaft, smithy, carpenter's shop, &c. the total house with chimney-shaft, smithy, carpenter's shop, &c. the total superficial area being 16,480 feet.—For further particulars apply to Messrs. FULLER & HORSEY, 13, Billiter-street, E.C.

SITE for the Erection of a Public Building WANTED, in the City, near Cornhill, Fenchurch-street, Gracechurch-street, Lombard-street, or Cheapside. A frontage of not less than 50 feet, with depth of about 80 feet.—Full particulars to be forwarded to S. O RATTENBURY, Esq. 6, John-street, Bedford-row, W.C.; or T. WARBURTON SIENT, Esq. 11, Park-street, Westminster, S.W.

TO BUILDERS.—A Pair of Semi-detached Houses, now in carcase, require FINISHING. Plans and specifications to be seen, with all particulars, at the Office of JOHN BERNEY, Esq. Architect, North End, Croydon.

TO CONTRACTORS, BUILDERS, and BRICKMAKERS.—Near to Morden, Old Malden, and Worcester Park and Sutton Railway Stations.—TO BE LET, about EIGHTY ACRES of very first rate BRICKEARTH LAND, which may be worked (without brickmaking plant) at a moderate royalty. Specimens of various articles manufactured from the clay may be inspected, and further information obtained, at the Offices of Messrs. WIGG, SON, & OLIVER, No. 7, Bedford-row, W.C.

WHARF.—TO BE LET on LEASE, a WHARF, 200 feet deep, and river front 178 feet 6 inches, with dwelling-house, out-buildings, gantry-frame, &c. at Charlton, near Woolwich Dockyard.—Apply to the Wharfinger, on the Premises; or Mr. HARVEY, 23, Holywell-street, Westminster.

PANGBORNE, BERKS.—Valuable Freehold Land, within five minutes' walk of the most beautiful part of the river Thames and of the railway station, and about one hour's journey from London. TO BE LET, in large or small lots, about 200 ACRES of LAND, admirably adapted for gentlemen's residences and villas, delightfully situated, with fine views of the country and river Thames.—Apply to W. E RATCLIFFE, Esq. Solicitor, Ryde Isle of Wight; or to F. NEWMAN, Esq. Surveyor and Architect, Ryde, Isle of Wight.

PRIZE MEDAL TO MAW & CO. INTERNATIONAL EXHIBITION, 1862.

IMPERISHABLE TESSELATED PAVEMENTS, combining a highly decorative and economical substitute for ordinary floors of their perishable coverings. MAW & CO'S Pattern-book, designed by M. Digby Wyatt, esq. together with a special design and estimate of cost adapted to any given dimensions of hall, passage, conservatory, verandah, frieze, &c. will be sent on application to Benthall Works, Broseley, Salop.

May be seen at the Exhibition of Building Inventions, &c. now open at the Galleries of the Architectural Exhibition, 9, Conduit-street, free.

London Agents—W. B. SIMPSON & SONS, 456, West Strand, who have on view a great variety of Specimens of the Pavements.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 21 Wharf, Macclesfield-street North, City-road Basin, N. Sndly, that the trade term, "TERRO-METALLIC," is the exclusive right of the Proprietor; and 3rdly, that the "Reports of the Juries," page 681, of the Great Exhibition, 1851, note the grant of a First-class Medal and rank the Manufactories known so long as "The Tileries," Tunstall, Staffordshire, as the first of the kind in the world.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION. MAGNUS'S ENAMELLED SLATE obtained the Medal of the Society of Arts; the Prize Medal at the Great Exhibition, 1851: Two First-class Medals at the Paris Exhibition; and Two Prize Medals at the International Exhibition of 1862.

Trashy imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.

Chimney pieces, Billiard-tables, Table-tops, Baths, Wall-linings, &c. a New Illustrated Catalogue of which can be had at the Pimlico Slate Works, 30 and 40, Upper Belgrave-place, Pimlico, S.W.

} SOLE CONSIGNEES.

The usual commission allowed to merchants of the trade.

N.B.—Every Description of the Building Goods of the Trade always in Stock.

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr ROBERT WHITE, and which may be seen in operation at the Brickfields of

J. B. WHITE & BROTHERS, Erith, Kent.

The advantages of this plan are two fold.

1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which in itself represents a large permanent saving.

2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.

Licenses for use of the Patent granted to Brickmakers, on application to the Patentees, 17, Millbank-street, Westminster.

FIRE BRICK and CEMENT WORKS

SMYRK will SELL by AUCTION, on the PREMISES, as above, on WEDNESDAY, JANUARY 13th, at TWELVE for ONE, punctually, 300 lots of long and TIMBER in scantlings, varying from 4 inches by 2½ inches up to 16 inches square, long sound flooring boards, 2-inch doors, sashes and frames, handsome wood columns and pilasters, 5 cwt. of nine sheet gl ss, pan and plain tiles, stack firewood, stores, &c. &c being the materials of buildings pulled down for improvements. On view, with catalogues may be had on the Premises the day prior to the Sale; or of Mr. C. F. SMYRK, 10, Newington-place, S.

WANDSWORTH COMMON, SURREY.—ELIGIBLE FREEHOLD BUILDING LAND.

MR. WHITTINGHAM is instructed to SELL by AUCTION, at the MART, London, on MONDAY, JANUARY the 18th 1864 at TWELVE for ONE o'clock, Twenty-five Lots of Eligible FREEHOLD BUILDING LAND, free from tithe and land tax, situate on the roads leading to Wandsworth, Tooting, and Clapham, close to Wandsworth Common, and within a short distance of the Wandsworth, Clapham Junction, and Balham Stations, on the South Western, Victoria, Crystal Palace, and Kensington Railways. Nine tenths of the purchase money may remain on mortgage or contract at 5 per cent; to be paid in nine years by half-yearly instalments; but the whole or any part of the balance may be paid off at any time, without notice.—Particulars, plans, and conditions of sale may be obtained (ten days before the sale) at the principal Inns in the neighbourhood; of Messrs. RUSSELL & DAVIES, 69, Coleman-street, London, E.C.; of the Foreman, on the Estate; of the Auctioneer, 14, Moorgate-street, London, E.C.; and at the Place of Sale.

ACTON, MIDDLESEX.—Eligible FREEHOLD BUILDING LAND, near the Railway Station.

MR. WHITTINGHAM is instructed to SELL by AUCTION, at the MART, opposite the Bank of England, on MONDAY, JANUARY 18th, at TWELVE for ONE, in thirty-nine lots, the remaining portion of the eligible FREEHOLD BUILDING LAND, being part of the orchard of the Grove House Estate, situate near the village of Acton, and to the Acton station on the North and South-Western Junction Railway. One lot, with a frontage to the road leading from the church to the station, is most eligible for villa residences, and the only one on this portion of the estate set apart for that purpose. Nine tenths of the purchase-money may remain on mortgage or contract, at five per cent to be paid in nine years, by equal half-yearly instalments, but the whole or any part of the balance may be paid off at any time without notice. Particulars, plans, and conditions of sale may be obtained ten days before the sale, at the Inns of the neighbourhood; of Messrs. RUSSELL & DAVIES, 69, Coleman street, E.C.; of the Auctioneer, 14, Moorgate-street, E.C.; and at the Place of Sale

ADDISCOMBE COLLEGE, CROYDON, SURREY.—Eligible Freehold Building Land.

MR. WHITTINGHAM is instructed to SELL by AUCTION, at the MART, London, on MONDAY, 25 h of JANUARY, 1864, at TWELVE for ONE o'clock, a further portion of this eligible Estate, consisting of about Fifty Lots of Eligible FREEHOLD BUILDING LAND, like the rest, and land for redeemed, situate close to the proposed Addiscombe Station on the Mid Kent Railway, with frontage to the St James and Channingroads, and forming a portion of the most eligible property. The lots are well adapted for first-class residences, and one corner plot, close to the station, is set apart for a shop. The Parade and East Croydon Railway Stations are within ten minutes' walk, and that at West Croydon about a mile distant. Nine-tenths of the purchase money may remain at mortgage or contract, at 5 per cent, to be paid in nine years, by half-yearly instalments; but the whole or any part of the balance may be paid off at any time, without notice. Particulars, plans, and conditions of Sale may be obtained (ten days before the Sale, at the principal Inns in the neighbourhood; of Messrs. RUSSELL & DAVIES, 69, Coleman street, E.C.; of the Auctioneer, 14, Moorgate street, London, E.C.; and at the Place of Sale

Particulars and conditions may be had at the office of PHILLIPS & SON, No. 2, City road, Finsbury square, to whom all Tenders must be sent on or before the 12th instant.

THE GREAT FIRE IN THE CITY.—

"A closer examination yesterday of the track of the recent fire in Wood-street, shows in a striking manner how much it was confined to a class of buildings the interior arrangements and means of communication of which appear to have been made in defiance of ignorance of the principles which regulate such matters, under the operation of the Metropolitan Building Act. The warehouses and offices which have perished seem to have been separated from each other by thin lath and plaster partitions for the most part, and only in one instance was there an iron door between the party of the same building and another, such as is now commonly used and made imperative, indeed, in the construction of warehouses, and as a valuable means of shutting off communication in case of fire. That iron door, too, which remains unpierced, would have been completely effectual in arresting the flames had they not penetrated by a vulnerable point into the part of the building which it protected

THE TRIUMPH OF IRON FOR SAFETY AGAINST FIRE was most conclusively proved by a very remarkable circumstance. The large and handsome warehouses of Messrs. J. & R. Morley, situate at the corner of Wood-street and Cheapside, presented to a large window on the ground floor at the back the little court in which the fire originated, and to such it was at first confined. THIS LARGE WINDOW WAS FURNISHED WITH THE OUTSIDE BY A REVOLVING IRON SHUTTER, AND THAT MORE AGAINST ROBBERY THAN FIRE.

On this occasion the door was found closed fiercely, but harmlessly, about the outside of the window so guarded by the iron shutter. Had they once entered Messrs. Morley's premises at that point, the stock stored inside, and estimated at from 250 000 to 300,000l., would inevitably have been destroyed, if indeed the devastation would have ended in that case but pile of building. Upon such a fact, London and property almost fabulous in value, all belonging to a single firm, depend in this case."—*Times*, 29th December, 1863.

THE REVOLVING IRON SHUTTER THAT ARRESTED THIS FIRE WAS MANUFACTURED IN 1849, BY

BUNNETT & CO., Patentees,
London & Glasgow.

MONEY on FREEHOLD and LEASEHOLD PROPERTY, by the MUTUAL LOAN FUND ASSOCIATION

(Incorporated by Act of Parliament, 1850), 14, RUSSELL STREET, Covent Garden, W.C. Advances from 100l. to 1,000l. upon Freehold and Leasehold Property for any term up to ten years. Mortgages redeemed, and the advance can be repaid by easy instalments. Facilities afforded to tenants to purchase the houses they occupy, and the repayment of the advance taken as rent. Greater advantages are offered to borrowers than in building societies, there being no shares to subscribe for, or competition for an advance, and no deduction from the loan. No preliminary fees. Prospectus and forms of proposal sent on receipt of a directed stamped envelope.

EDWARD HARPER, Secretary.

ADVANCES are made by the SOVEREIGN LIFE OFFICE, 48, St. James's street, London, of sums not exceeding 1,000l. to Officers and other persons resident in England, upon their personal security, repayable for repayment by instalments in three years, at five per cent. interest.

TO MILLWRIGHTS, ENGINEERS, &c.

By order of the Executors of Mr. J. T. Coltman deceased.—TO BE SOLD, the GOODWILL of a BUSINESS, which has been successfully carried on by the late proprietor and his sons, in the town of High Wycombe, for upwards of 100 years. The Stock in Trade, Fixtures, Steam-engine, Machinery, and Tools, to be taken at a valuation, with the option of purchasing the House, Garden, and Premises. For information, or to view the premises, apply to Mr. H. HAYDEN, Esq. or the Executors, Messrs. R. WHEELER and T. LUCAS, all of High Wycombe, Bucks.

POLYTECHNIC. — Patron, H.R.H. the PRINCE of WALES. — Professor Pepper.—The Ghost.—J. H. Pepper's adaptation of H. Dirks's Ghost Illusion, with the new patented improvements by the Inventor, Alfred Smith.—Mr. Boodtree's The Illustrated Fairy Tales, the Sixteen Pantomime, the Christmas Tree, the Improved Chinese Fireworks. The Entertainments and Lectures provided this year are on the most liberal scale.

TO INVENTORS.—All intending Patentees should procure the PRINTED INFORMATION regarding PATENTS—their cost, and mode of procedure—to be obtained gratis by the General Patent Company (Limited), 71, Fleet street, London. ROBERT M. LATHAM, Secretary.

London:—Printed by CHARLES WYMAN, Printer, at the Printing-office of Cox & Wyman, Nos. 74 and 75, Great Queen street, Lincoln's-inn-fields, in the Parish of St. Giles-in-the-fields; and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," No. 1, York street, in the Parish of St. Paul, Covent garden, both in the County of Middlesex.—Saturday, January 9, 1864.

JOSEPH BIRD, Hon. Sec.

10, Hanover Cottages, Regent's Park, N.W.

BY ORDER of the SECRETARY of STATE for INDIA in COUNCIL.

Notice is hereby given, that TWENTY-FIVE APPOINTMENTS in the UPPER CLASS of the ELECTRIC TELEGRAPH DEPARTMENT in India will, in the year 1864, be open to PUBLIC COMPETITION.

A Competitive Examination will, accordingly, be held in this office in the month of MAY next. Full printed particulars of the conditions on which candidates will be admitted to the Examination, and also respecting the nature of the Appointments to be competed for, may be obtained at this Office, on application, either personally or by letter, addressed to the "Under Secretary of State for India," India Office, London, S.W.

November 20th, 1863.

THE ARCHITECTURAL MUSEUM, SOUTH KENSINGTON MUSEUM, W.

PRIZES FOR COLOURED DECORATION.

5l. 5s., and 3l. 3s. are now offered. The Competition will be open till MARCH 1st, 1864. Casts for colouration, price 5s. and full particulars may be had by letter to the Honorary Secretary, at 13, Stratford-place, W.

A. J. B. BERESFORD HOPE, President.
GEO. GILBERT SCOTT, Treasurer.
JOSEPH CLARKE, Hon. Sec.

All requests for Casts for Colouration must be accompanied by a Post-office Order on Charing-cross for 5s.; or if case and packing required, 7s.

BILLING'S PATENTS.—CHIMNEY TERMINALS.—THROAT VALVES.—NOTICE to ARCHITECTS.—The Proprietors of these PATENTS have given the Widow an interest in the same, and have considerably reduced the prices of the Articles, trusting that by so doing these useful Inventions may be introduced more generally in all new buildings.—For prices, apply to the Manager, Mr. TYLER, 12, Abingdon-street, Westminster, who will also afford any information, he having been for many years engaged with the late Mr. BILLING, in the practical curing of Smoky Chimneys.

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 72—74, Bishopsgate-street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Medal Ranges and Stoves, Register Grates, and Cooking Utensils, to meet the great public demand; and also for the consequent more extensive execution, by the manufacturers themselves, of all descriptions of hot water, bath, laundry, and steam work.

72—74, Bishopsgate-street Within, November, 1863.

PROVIDENT INSTITUTION of BUILDERS' FOREMEN and CLERKS of WORKS, No. 9, Conduit-street, Regent-street.—The ANNUAL MEETING of the above Institution will be held on WEDNESDAY EVENING next, JANUARY 20, 1864, when officers for the ensuing year will be elected, and other business of importance brought before the meeting. The chair will be taken at EIGHT o'clock.

JOSEPH KAY, Corresponding Secretary.

LONDON INSTITUTION, January 9th, 1864.—At the SECOND CONVERSAZIONE of the present season, WEDNESDAY, the 20th instant, a LECTURE will be delivered by C. T. BEKE, Esq. Ph. Dr. F.S.A. &c. Manager, London Institution, on the SOURCES of the NILE, and on the means requisite for their final determination. To be commenced at EIGHT p.m. precisely. By order, WM. TITE, Hon. Secretary.

GEOLOGY.—KING'S COLLEGE, LONDON.—Professor TENNANT, F.G.S assisted by the Rev. T. WILTSHIRE, M.A. will give a COURSE of LECTURES on GEOLOGY, on WEDNESDAY evenings, from EIGHT to NINE o'clock. The first Lecture, JANUARY 20th, to be continued to Easter. A more extended Course will be given on WEDNESDAY and FRIDAY mornings, from NINE to TEN o'clock, commencing JANUARY 27th, and will be continued to JUNE. R. W. JELF, D.D. Principal.

COMPETITIONS.

WYGGESTON'S HOSPITAL, LEICESTER.—To ARCHITECTS.—The Trustees of the above Hospital are desirous of receiving DESIGNS, with general specifications and estimates, for the ERECTION of a NEW HOSPITAL, for Twenty-five Inmates, with a Chapel, a House of Residence for the Master of the Hospital, a similar House of Residence for the Chaplain Brother, a Board-room, a Muniment-room, with other convenient Offices, and a Porter's Lodge, with suitable Entrance Gates; and for the Laying out of the Ground. It is proposed to expend on the above object the sum of 13,000l. Premiums will be awarded by the Trustees for the three best designs. All designs are to be sent in under a motto, to be accompanied by a sealed letter by which the author may be identified, with his designs, but which letter will not be opened until after the selection has been made by the Trustees from the several designs. A lithographic plan of the site, with sections of the land and conditions and Instructions for the guidance of intending competitors, may be had at any time after the 1st of FEBRUARY next, upon application to the undersigned, and on payment of the sum of 7s.; and all plans are to be forwarded carriage free to the said undersigned on or before the 25th day of APRIL next.

WILLIAM H. MACAULAY, Solicitor, Leicester,
Clerk to the Trustees of the above Hospital.

January 8th, 1864.

CONTRACTS.

TO BUILDERS and OTHERS.—TENDERS are required for COMPLETING, fit for occupation, the CARCASES of FOUR Houses, situate and being Nos. 9 to 12, in Lawn-terrace, Lee, Kent near the Blackheath Railway Station, on the North Kent Railway; and the drawings, specification, and conditions of contract for these works can be seen at the Offices of Mr. F. P. THORNE, Architect, at No. 4, Corbet-court, Gracechurch-street, London, and Lee-road, Lee. The Tenders are to be delivered at No. 4, Corbet-court, Gracechurch street, London, at TWELVE o'clock, on MONDAY, the 25th instant; and the lowest or any other Tender will not necessarily be accepted.

January 6, 1864.

TO BUILDERS.—CHINNOR, OXON.—Parties willing to CONTRACT for the RESTORATION of, and other WORKS to, Chinnor Church, in the county of Oxford, are hereby informed that the drawings, specifications, and conditions of contract thereof, may be seen at the National School room, Chinnor, on and after the 14th instant.—Tenders properly endorsed and sealed, to be sent to the Rev. F. BUTTENSHAW, Chinnor, Petersham on or before the 30th instant. The Committee do not bind themselves to accept the lowest or any other Tender.

EDWARD BANKS, Architect.

Wolverhampton, January 6th, 1864.

LANCASHIRE and YORKSHIRE RAILWAY. The Directors are prepared to receive TENDERS for the CONSTRUCTION of a BRANCH RAILWAY from Lockwood to Meltham, near Huddersfield Length about 3¼ miles.—Plans and specifications may be seen and forms of Tender obtained at the Engineer's Office, Hunt's Bank, Manchester, on and after MONDAY, the 4th JANUARY proximo, and Tenders, properly endorsed and addressed to the Directors, must be in the hands of the Secretary not later than MONDAY, the 15th FEBRUARY, 1864.

Manchester, December 18, 1863. WM. S. LAWN, Secretary.

BOARD of WORKS, WHITECHAPEL DISTRICT.—A meeting of this Board will be held on MONDAY, the 18th day of JANUARY, 1864, at SIX o'clock in the evening at the Office, 15, Great Alie-street, Whitechapel, to receive TENDERS for the CONSTRUCTION of a BRICK SEWER in Dook-street, Whitechapel. Plans, sections, and specifications may be inspected, and further particulars, with printed forms of Tender obtained, on application to Mr. FINCKER, Surveyor, between the hours of TEN and FOUR, at the Office of the Board. Sealed Tenders, in which a 10l. note is to been closed, must be delivered at the Office previous to the hour of meeting; and any Tender which is not upon the form prepared by the Board, and duly signed by the person or persons tendering, will be rejected. Persons tendering, or their representatives, are required to attend the meeting of the Board. The Board do not bind themselves to accept the lowest or any Tender.

ALFRED TURNER, Clerk to the Board

15, Great Alie-street, Whitechapel, 6th Jan. 1864.

BUILDERS desirous of TENDERING for the COMPLETION of FOUR HOUSES, near Herne Bay, are requested to send their names for selection to Mr. MANNE, Ramsgate, Kent. Those parties who require copies plates and abstract must remit half-a guinea.

CONTRACTS.

WAR DEPARTMENT CONTRACT.—Persons desiring to TENDER for the SUPPLY and DELIVERY at the Royal Arsenal, Woolwich, of certain RAILWAY RAILS, CHAIRS, FISH PLATES, SLEEPERS, &c. can obtain Forms of Tender, and all other information, by applying at the Works Department Office, Royal Arsenal, Woolwich, on or before WEDNESDAY, 20th JANUARY, 1864.

The Secretary of State does not bind himself to accept the lowest or any Tender.

January 14th, 1864.

TO BUILDERS.—Parties desirous of TENDERING for the ERECTION of a MUSIC HALL, on a plot of land in Commercial-street, Whitechapel, can inspect the plans and specifications, and obtain bills of quantities, on application to the Architect, Mr R. H. MOORE, 10, Walbrook, Mansion House, E.C. on any day until THURSDAY, the 21st inst. when the Tenders are to be delivered at the above address, at THREE o'clock p.m.

TO BUILDERS, &c.—Notice is hereby given, that plans and specifications for the ALTERATION and RESTORATION of the PARISH CHURCH of Baldon Toot, six miles from Oxford, will be lying at the School house from the 25th to the 30th proximo, both days inclusive; and all persons desirous of CONTRACTING for the works must send in sealed TENDERS, directed to the Rev EDWARD PEEL, The Vicarage, Baldon Toot, on or before the 10th day of FEBRUARY next. Neither the lowest Tender nor any will necessarily be accepted. The contractor must be prepared, if required, to enter into the usual legal bond for the due execution of the work, with two good and approved securities.

TO BUILDERS. — Persons desirous of TENDERING for the WORKS required in the ERECTION of a NEW WESLEYAN CHAPEL and SCHOOLS intended to be built in Marlborough-road, Banbury, Oxon, may see the plans and specifications, and obtain quantities at Mr. KILBY'S Office, No 43, High-street, Banbury, from FRIDAY, the 15th JANUARY, till THURSDAY, the 4th FEBRUARY, next.—Sealed Tenders to be sent in, not later than THURSDAY, the said 4th day of FEBRUARY, to JOHN KILBY, Esq. Banbury, Oxon, endorsed "Tender for Chapel and School." The Committee do not pledge themselves to accept the lowest or any Tender. G. WOODHOUSE, Architect.

St. George's-road, Bolton-le-Moors, January 13th, 1864.

TENDERS.—Notice is hereby given, that the Hastings Local Board of Health are ready to receive TENDERS from persons desirous of CONTRACTING with them for the SUPPLY of 140 Cast Iron GULLY GRATINGS and FRAMES. The specification and models may be seen, and further particulars had, on application at the Town Clerk's Office, High street, Hastings, where Tenders, duly signed, must be delivered before TEN o'clock of the morning of MONDAY, the 1st day of FEBRUARY next. The Local Board do not bind themselves to accept the lowest or any Tender

ROBERT GROWSE, Town Clerk.

Hastings, January 13th, 1864.

TO BUILDERS and CONTRACTORS.—A Pair of semi-detached HOUSES, now in carcase, require FINISHING. Plans and specifications to be seen, with all particulars, at the Office of JOHN NEWBERY, Esq. Architect, North End, Croydon. Sums of not less than 200l. will be paid as the works proceed and are certified.

CROYDON LOCAL BOARD of HEALTH. To STONE MERCHANTS and OTHERS.—Persons desirous of CONTRACTING with the Croydon Local Board of Health for the DELIVERY at Croydon of a quantity of 4 in. by 19 in., and 6 in. by 12 in. Quantities have been prepared, and a copy of them and form of Tender can be had on application at the Offices of the Architect on payment of one guinea. An early application is requested in order to regulate the number or copies. The Tenders are to be sent sealed, under cover to me, on or before TWELVE o'clock on MONDAY, the 8th FEBRUARY next. The Committee do not bind themselves to accept the lowest or any Tender; and any party whose Tender may be accepted must provide good and sufficient security GEORGE STOKES, Secretary.

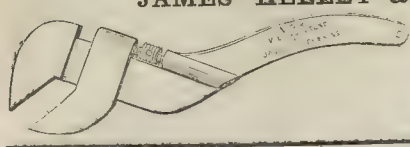
Saffron Walden, 13th January, 1864.

METROPOLITAN IMPROVEMENTS.—SOUTHWARK STREET.—The Metropolitan Board of Works hereby give notice, that they will meet at their Office, in Spring-gardens, Charing-cross, on WEDNESDAY, the 2nd MARCH, next, at TWELVE o'clock at Noon, precisely, and will be prepared to open TENDERS by parties who may be willing to take on BUILDING LEASES all or any of certain PLOTS of GROUND, situate on the north and south sides of Southwark-street, from High-street, Borough, to Blackfriars road. Particulars, conditions, and form of Tender, and every information may be obtained in the Superintending Architect's Office, at the Office of the Board, on and after the 1st of FEBRUARY next, between the hours of NINE a.m. and FOUR p.m. The Tenders must be on the printed form supplied at the Office of the Board, and be delivered under sealed cover, addressed, "Tender for Ground in Southwark-street," and addressed to the Clerk of the Board, at the Office of the Metropolitan Board of Works, Spring-gardens, S.W. before TWELVE o'clock at noon, on the said 2nd MARCH next, and no Tender will be received after that hour The Board do not bind themselves to accept the highest or any Tender.

JOHN PULLEN, Clerk of the Board.

Spring gardens, Charing-cross, 9th January, 1864.

[For remainder of Contracts see next Page.]



BY HER MAJESTY'S ROYAL LETTERS PATENT.

WILSON'S DOUBLE-ACTION SCREW SPANNER,

MANUFACTURED BY

JAMES HEELEY & SONS,

Mount-street, Birmingham.

The superiority of this Spanner consists in its novel and rapid mode of adjustment by a double action screw, and its new and convenient arrangement of curved handle and oblique jaws, which, combined with its superior strength and excellent workmanship, renders it by far the best and handiest tool of its class hitherto produced. It is being extensively used by Furnishers, Manufacturers, Machinists, and Railway and Steamboat Companies, and can be had of all respectable Ironmongers.

TO CONTRACTORS and CARPENTERS.—Parties desirous of furnishing a TENDER for PROVIDING and ERECTING THREE QUARTERS of a MILE of ROUGH POST and RAIL FENCING on Morden Common, Surrey, may obtain further particulars from Messrs. WIGG, SON, & OLIVER, 9, Bedford-row, W.C.

TO WELL-SINKERS.—The Uxbridge Board of Local Board of Health hereby give notice that they are desirous of receiving TENDERS for SINKING a WELL, 52 feet deep, 7 feet in diameter, and in doing other works at their Cemetery, situate in the Western-road, Uxbridge. The specification and plan may be seen at the office of Mr. GEORGE EVES, Uxbridge. The Board do not bind themselves to accept the lowest or any Tender. Tenders, endorsed "Tenders for Well," must be sent in to the Surveyor of the Board, Uxbridge, on or before TWELVE o'clock of THURSDAY, the 4th of FEBRUARY next.

NATIONAL SHAKSPEARIAN TERCENTENARY FESTIVAL, STRATFORD-UPON-AVON.—To DECORATORS and OTHERS.—Persons desirous of tendering in Designs and Builders for the DECORATION of the PAVILION now being erected at Stratford-upon-Avon, can see the specification and particulars at the Office of Messrs. THOMPSON & COLBURNE, Architects and Surveyors, Henley-street, Stratford-upon-Avon, on and after MONDAY, the 18th inst. Tenders to be sent, addressed to the Chairman of the Building Committee, Town-Hall, Stratford-upon-Avon, endorsed, "Tenders for decorating the Pavilion," on or before TWELVE o'clock, Noon, MONDAY, FEBRUARY 8th. The Committee do not bind themselves to accept the lowest or any Tender.

ROBERT E. HUNTER, Secretary.
By order.

TO BUILDERS.—The Directors of the Farnborough Cottage Company (Limited) are prepared to receive TENDERS for the ERECTION of TWELVE COTTAGES, at Farnborough, near Aldershot. The plans, specification, and conditions of contract may be inspected at the Architect's Office on and after SATURDAY, the 16th inst. The Tenders are to be delivered at the Office of the Architect, on TUESDAY, the 26th instant, at TWELVE o'clock, sealed, and endorsed "Tenders for Cottages at Farnborough." Before we will be required, and the Directors do not bind themselves to accept the lowest or any Tender.

HENRY CURREY, Architect.

4, Lancaster-place, Strand, W.C. January 14, 1864.

ST. PANCRAS IRON WORK COMPANY,
OLD SAINT PANCRAS ROAD, AND YORK ROAD, KING'S CROSS.

CRANE WANTED, to LIFT ONE TON, with the necessary gear, on a carriage with wheels.—Address' with full particulars and price, to X Y Z Leathwait & Simmons, Newspaper Office, Pope's Head alley, Cornhill.

IMPORTANT to BUILDERS and OTHERS.—Improved Circular Saw Tables.—The Advertiser, WILLIAM SKETCHLEY, has invented and perfected an IRON DISC for PLANING FLOOR-BOARDS to any width and thickness required, cutting the grooves and tongues off at the same time, and others to the importance and immense saving effected by it. The Disc is attached to the spindle without any trouble as the circular saw, and will prepare the surface of ten squares per hour. To give orders, or for information, apply to the Inventor, WILLIAM SKETCHLEY, Great George-street, Weymouth.

BUNNETT & CO.

PRIZE MEDAL, GREAT EXHIBITION,

FOR

REVOLVING IRON SHUTTERS.

No. 1.—Patent, Bank Quality, with best Worm and Wheel Gearing, 6s. per foot.

No. 2.—Patent, for Shops and Offices, with best Chain Gearing, 5s. per foot.

No. 3.—Patent, for Private Houses, without Gearing, raised and lowered with Balance Weights, 3s. 6d. per foot.

BUNNETT & CO. invite the attention of Architects and Builders to their recent improvements in LIGHT REVOLVING IRON SHUTTERS for the WINDOWS of PRIVATE HOUSES, raised and lowered with graduated balance weights, without any gearing.

A matured experience, extending over twenty-five years, has convinced the Patentees that *no permanent dependence can be placed in any other*

SYSTEM OF

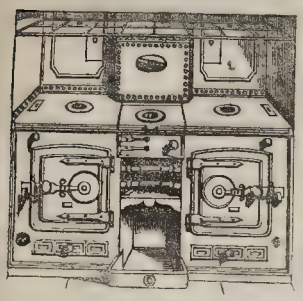
SELF-COILING SHUTTERS.

BUNNETT & CO.'s

Widely-known and well-appreciated

BANK SHUTTER

requires no comment, as it is in use in a large majority of the Banking Establishments, Goldsmiths' Shops, and Public Offices of the United Kingdom and the British Colonies; but the Patentees wish to make it known that they have recently completed extensive Additions to their



WORKS AT DEPTFORD,

and have erected new and most powerful Machinery with the view of meeting the largely-increasing demand for the

REVOLVING IRON SHUTTER,

With all necessary Despatch.

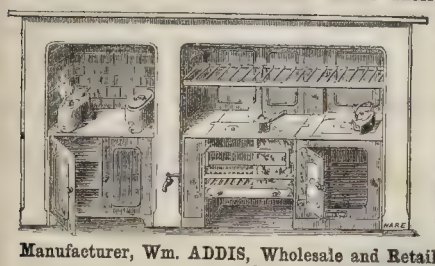
THE IMPROVED OPEN FIRE KITCHENER,

Manufactured by

WM. OWEN,
PHŒNIX IRON WORKS,
ROTHERHAM,



Possesses all the advantages of the ordinary Close Fire Kitchener, in having excellent Hot Plates on top of Ovens, for boiling, steaming, or stewing, with the additional advantage of having a thoroughly effective and deep OPEN Fire for roasting purposes.

The Ovens are heated upon Bradley's Patent Principle (under which W. O. possesses the sole right to manufacture), and by which a great economy of fuel is effected.

These Kitcheners are made of all qualities and sizes, suitable for all classes of houses, from the cottage to the mansion; and can be OBTAINED THROUGH ANY IRONMONGER in the UNITED KINGDOM.

WM. OWEN,
GENERAL IRONFOUNDER, STOVE GRATE AND FENDER MANUFACTURER,
PHŒNIX WORKS, ROTHERHAM.

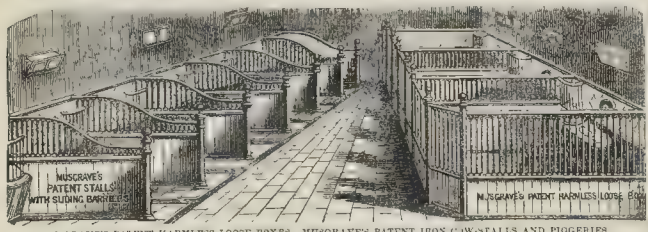
BARTON'S PATENT PRIZE MEDAL STABLE FITTINGS.

Three SUPERIOR-CLASS STABLE FITTINGS are PATRONIZED by the PRINCIPAL NOBILITY, and ADOPTED by many of the FIRST ARCHITECTS and BUILDERS of the United Kingdom.

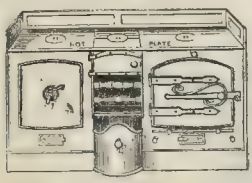


J. BARTON solicits attention to the NEW STABLE just completed, with full size Stalls, Loose Boxes, and Harness Room, now open for inspection, at the Manufactory, 370, Oxford-street, where an extensive assortment of all kinds of Stable Furniture, upon the most modern and improved principles, are to be seen.

A new Illustrated Catalogue, with numerous engravings of the improved method of fitting up Stables, forwarded on receipt of four stamps.

JAMES BARTON, IRON WORKS, 370, OXFORD STREET, LONDON, W.

EXHIBITION PRIZE MEDAL, 1862, AND MEDAL OF ROYAL AGRICULTURAL SOCIETIES OF ENGLAND AND IRELAND.



MUSGRAVE'S PATENT STABLE AND HARNESS FITTINGS.

MUSGRAVE'S PATENT HARMLESS LOOSE BOXES, MUSGRAVE'S PATENT IRON COW-STALLS AND PIGGERIES.

Architects who have not seen these Fittings are requested to write for Engravings, as they are unlike those of any other maker, and were admitted to excel all the work of their class in the Exhibition. They can be seen in first class stables in almost every county in England and MUSGRAVE, BROTHERS, are now fitting several very large establishments under directions of London Architects, noted for adopting only what is the best of its kind. Particulars of these, as well as of MUSGRAVE'S PATENT SLOW-COMBUSTION STOVE, will be forwarded on application to

MUSGRAVE, BROTHERS, ANN STREET IRON WORKS, BELFAST.

THE LEAMINGTON PRIZE KITCHENER.

These Ranges are strongly recommended for Economy, Cleanliness, and a Cure for Smoky Chimneys.

The Top forms an entire and efficient Hot Plate, and having an Open Fire, removes all the objections of a Close Fire-range.

A large STOCK of SELF-ACTING and other RANGES, REGISTER STOVES, and every description of BUILDERS' IRONMONGERY, at Wholesale Prices.

All Goods delivered free within Five Miles.

BURT & POTTS,

WHOLESALE AND MANUFACTURING IRONMONGERS

38 and 65, York-street, Westminster

BROWN & GREEN'S

PATENT KITCHEN RANGES.

PRIZE MEDAL, 1862.

These Ranges combine the latest improvements with great simplicity and durability. They afford facility for roasting meat in front of the fire without interruption to the action of the oven, hot plate, boiler, &c. The Ovens are well ventilated, and perfect either as roasters, or for baking bread or pastry. For Efficiency, Economy, and Ventilation, and

CURE OF SMOKY CHIMNEYS,

these Ranges are unequalled. They are of all sizes and prices; and when fitted with Bath and Steam Apparatus, &c. they form the most complete appointment for good establishments. Designs, &c. may be had on application at THE LONDON WAREHOUSE,

72—74, BISHOPSGATE STREET WITHIN.

"One of the best arrangements of the 'Kitchener.'"—See *Builder*, Sept. 6, 1862.

DRAUGHTS & DUST ROUND DOORS & WINDOWS

EFFECTUALLY PREVENTED BY

GREENWOOD'S PATENT INDIA-RUBBER MOULDINGS

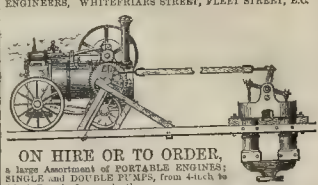
(*Can be had any Length or Pattern*).

The neatest, most simple, and effectual method of making air-tight joints to joiners' or cabinet work OLD or NEW.

Self acting Spring Slides for the bottom of doors.

The most imperfect door can be made air-tight without re-hanging.

The Trade supplied on liberal terms.



JOHN GREENWOOD, PATENTEE,

10, Arthur-street West, London Bridge.

Price List and Drawings on application as above.

PATENT ASPHALTE CALDRON, for laying asphalte floors. Three times highly recommended by the Royal Agricultural Society. The cheapest and best kind of floor, impervious to wet, and vermin will not touch it.—Full particulars sent free by

WOODS & COCKSEDGE,

IRONFOUNDERS, STOWMARKET

PATENT WORCESTERSHIRE RANGE.

PRIZE MEDAL 1862 AWARDED FOR EXCELLENCE.

The above RANGE is most complete, and strongly recommended for its unrivalled ECONOMY, CLEANLINESS, CONVENIENCE, DURABILITY, and is a certain CURE for SMOKY CHIMNEYS.

It is an entirely new invention, and consists of large MEAT ROASTER, PASTRY OVEN, and WROUGHT IRON BOILER. The top forms a HOT PLATE for BOILING, STEWING, &c. The whole heated by ONE SMALL FIRE. One 5 feet wide is equal to an ordinary Range 8 feet wide

Extracted from the "London Daily Telegraph," May 19th, 1862.

"INTERNATIONAL EXHIBITION, CLASS 31.

"Of the most recent inventions it should be said that Messrs. JONES & ROWE'S Patent Worcestershire Range has attracted very special attention, and has been commended by the best authorities. A valuable peculiarity of their Ranges is the placing of the OVEN and ROASTER one above the other instead of side by side; and the ROASTER is constantly replenished with fresh air."

INVENTORS AND MANUFACTURERS,

JONES & ROWE, WORCESTER,

AGENTS FOR LONDON: BARRON, SON, & WILSON,

436, STRAND, W.C.

Illustrated Catalogues, with Testimonials and Prices, forwarded on application.

KITCHEN RANGES.—BROWN BROTHERS' are the best adapted for heating BATHS, CONSERVATORIES, &c. and perfectly performing every other culinary operation. Require little or no fixing, save half the coals, cure smoky chimneys. The only Range which can use the Patent Automaton Roaster. In operation daily at the Depôt.—LONDON: 43, CRANBOURN STREET, W.C. Illustrated Catalogue post free. Hot Water Apparatus for Buildings.

BUILDINGS AND SHIPS EFFECTUALLY SECURED AGAINST LIGHTNING.

PATENT LIGHTNING CONDUCTORS,

according to the system of Sir Snow Harris, F.R.S. as now universally adopted in every department of the Public Service, supplied and carefully fitted in every detail, under the immediate instructions of Sir Snow Harris, by G. W. GRAY, who has effectually secured a large number of ships, public buildings, and magazines against the destructive agency of lightning, including the Houses of Parliament, magazines, afloat and on shore, of the War Department and many churches and other important structures. Buildings surveyed, and plans and estimates submitted, if called for.

J. W. GRAY & SON, 114, Fenchurch-street, E.C.

LIGHTNING CONDUCTORS.

R. S. NEWALL & CO. Patentees of the COPPER ROPE LIGHTNING CONDUCTOR, supply the same, with the point and all staples, complete for fixing, at the following prices:—

Three-eighths-inch diameter	1s. 0d. per foot.
Half-inch diameter	1s. 6d. "
Five-eighths inch diameter	2s. 0d. "

R. S. Newall & Co.'s Patent Copper Rope Lightning Conductor is being supplied by architects, engineers, and scientific men, in all parts of the world.

" 27, Dale-street, Manchester.
" 68, Abercromby-square, Liverpool
" 17, South Castle-street, Liverpool
" Exchange-road, Dublin.
" 7, Frederick-street, Aberdeen.

PROTECTION from LIGHTNING.

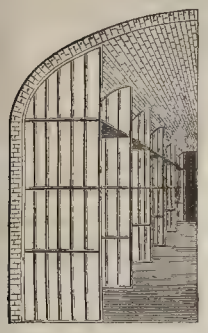
HART & SON

Beg to call the attention of Architects, Builders, and the public to their

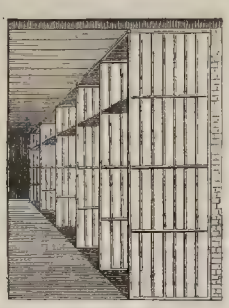
IMPROVED LIGHTNING CONDUCTORS

(SPRATT'S PATENT),

As presenting the MOST EFFECTIVE MEANS of OBTAINING SECURITY from LIGHTNING. They are economical, easily fixed, and APPLICABLE TO ALL BUILDINGS, including Private Houses, Churches, Chimney-Shafts, Dairies, Powder Magazines, &c. &c.



Price lists and estimates on application.



HART & SON,

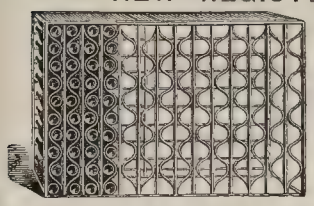
WHOLESALE AND MANUFACTURING IRONMONGERS,

53 to 58, WYCH ST. STRAND, LONDON, W.C.

WROUGHT IRON WINE BINS.

FARROW & JACKSON

Beg to call the attention of Architects and Builders to their Wrought Iron Wine Bins, which are ADAPTED (as shown) either for BRICK ARCHED VAULTS or CELLARS with FLAT CEILINGS, the mode of fixing in either case being so simple, that they may be put up by any ordinary workman. They combine great strength with lightness and economy of space, and their DURABILITY has been satisfactorily PROVED DURING nearly FORTY YEARS.



The Shelves are formed of Plates of Iron laid on Bars, which rest on the Cross-bars of the Lattice Uprights, and are removable at pleasure.

Plans and Estimates furnished, and Cellars fitted complete in any part of the Kingdom.

*** As these Bins were the invention of the late Mr. FARROW, and great attention has been given to them by the present Firm, long practical experience enables FARROW & JACKSON to offer the best advice as to arrangement.

ALSO THEIR

NEW REGISTERED IRON BINS,

Made any size or shape, to fit any spare corner, with

SEPARATE REST FOR EACH BOTTLE,

Peculiarly adapted for Private Cellars.

No laths are required, and all trouble of Binning is avoided. The Cellular Bins may also be had fitted with light lattice doors, affording perfect security to the contents of the Bin.

FARROW & JACKSON,

18, 17, and 16, GREAT TOWER STREET; and 1, HARP LANE, LONDON, E.C.

FACTORY, 57 and 58, MANSELL STREET.

SMOKY CHIMNEYS.

WOOD'S

PATENT CHIMNEY-TOP

Is simple in construction and certain in effect. It has a good shape, is durable, and easily swept by the sweeps' machine.

Price 2/6

Sent to all parts of the kingdom upon receipt of money order, addressed to the

PATENTEE, CAMDEN MANUFACTORY, CHISLEHURST, KENT.

SMOKY CHIMNEYS.

S. DEACON

Respectfully invites the attention of Architects, Builders, &c. to his

PATENT LOUVRE CHIMNEY CAP,

which has been in use some time with perfect success, many caring chimneys where other caps have been of no avail.

The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of impinging it, an increased up current, and the impossibility of a down one.

Prospectus forwarded on receipt of Postage Stamp, by

S. DEACON,

59, ALMA STREET, HOXTON, N.

MANUFACTORY: HEMSWORTH STREET, SAINT JOHN'S ROAD, HOXTON, N.

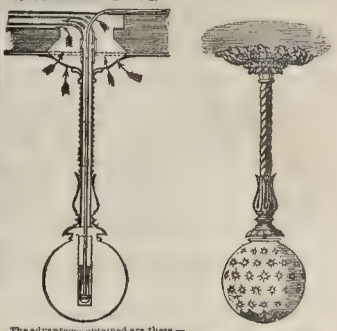
ROBERT MACLAREN & CO.

EGLINTON FOUNDRY, GLASGOW.



Manufacturers of all sizes of CAST IRON MAIN PIPES, for Gas or Water, by an IMPROVED PATENT.

GENERAL IRON FOUNDERS, GAS ENGINEERS, and WROUGHT IRON TUBE MAKERS.

RICKET'S & HAMMOND'S

VENTILATING GLOBE LIGHT,

combining an agreeable method of lighting, with convenient, simple, and efficient ventilation.

The advantages obtained are these—

A TOTAL REMOVAL OF ALL PRODUCTS OF COMBUSTION.

A COMPLETE DISPLACEMENT OF HEATED AND VITIATED AIR,

AND A CONSIDERABLE ECONOMY IN THE CONSUMPTION OF GAS.

A GLOBE LIGHT will consume 5 to 7 feet of gas per hour, giving as much light as an ordinary three-light chandelier, with a consumption of 12 feet per hour.

No. 5, CHANDOS STREET, CHARING CROSS, LONDON, W.C.

THE INTERNATIONAL EXHIBITION PRIZE MEDAL, AWARDED 1862.

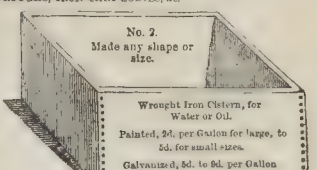
ESTABLISHED 1744

AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES.

To BUILDERS, CARPENTERS and BLIND MAKERS.

J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his

IMPERIAL PATENT FLAX SASH-LINES,



of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

DAY and GAS LIGHT REFLECTOR MANUFACTURER.—THOMAS FOX, 90, Hatton Garden, E.C. and 30½, Charles-street, Hatton Garden, E.C. A large assortment of Silvered Glass Globes, Lamp Spires, &c. always on hand. All kinds of Bent Glass Silvered.

CARVED TRUSS STATUARY MARBLE CHIMNEYPIECE, 14-in. PIERS, FOR £6.

VIEILLE MONTAGNE ZINC.

THE ITALIAN-FORMED ZINC is much approved of by Architects and Engineers on account of its strength, durability, and appearance. On account of the light framing required, roofs, including framework and fixing, can be covered with it FOR £3 PER SQUARE up to 25 feet span. Sheds of larger span, including posts, 4*l.* per square. Architects are cautioned against allowing anything thinner than No. 13 gauge (20 oz.) to be used. ALL PLATES SHOULD BE REJECTED NOT BEARING, in addition to the Company's name, the words "ROOFING ZINC," and the gauge.

OLD ZINC RETAKEN AT HALF THE MARKET PRICE OF NEW.

THE BUILDER'S and CONTRACTOR'S PRICE BOOK (Lockwood's, formerly Weale's) for 1864.

Revised by G. R. BURNELL, Esq. C.E.

This book is the universally recognized arbitrator in the settlement of disputed accounts. Not being printed from stereotype plates year after year, as is the case with other books of the kind, errors are not perpetuated, and the opportunity is taken in every reprint to introduce current prices and other desirable improvements.

LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Dedicated, by permission, to the Right Hon. Lord Palmerston.

DESIGNS for MONUMENTS, TOMBS, GRAVESTONES, &c. price 16s. complete in one volume.

By JOSEPH B. ROBINSON, Sculptor, Derby.

The designs in this volume are suitable for either cemetery or churchyard. The book forwarded free to any part of the kingdom for post-office order

A new edition, thoroughly revised and corrected, comprising a concise history of the English Language, a List of Synonymes, &c. By a Member of the University.

London: WILLIAM TEGG, Pancras-lane, Cheapside.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Baryte from ten to thirty per cent. Whether added by the Grinder or "Improved Zinc Paint," or as the name or Two or three quarties, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

Just published. Forty-fourth Edition, price 4s. bound in cloth,

LAXTON'S PRICE BOOK for 1864, for ARCHITECTS, ENGINEERS, BUILDERS, CONTRACTORS, SURVEYORS, &c. (established 1845), containing more than 50,000 Prices, together with Useful and Important Memoranda, &c. &c.

The reputation which this book has gained as a book of reference in general use by the professions and trades connected with Building, Engineering and Contracting, and the great increase in its circulation, are proofs that the efforts to render it as useful as possible have been recognized. To the present Edition a large amount of entirely new matter has been added, as will be seen on comparing it with the last Edition.

The work is not printed from stereotype plates: errors are, therefore, readily corrected in every reprint, and in each succeeding Edition such alterations and additions are made as will be found practically useful to the Architect, the Engineer, and the Operative.

London: SIMPKIN, MARSHALL, & CO. Stationers' Hall-court.

Supplied by all Booksellers.

Now ready, with 14 plates, royal 12mo. cloth, price 6s. (postage 4d.)

THE ENGINEER'S, ARCHITECT'S, AND CONTRACTOR'S POCKET BOOK (LOCKWOOD'S, formerly WEALE'S) for 1864. The present volume has been considerably improved, and much new matter added.

LOCKWOOD & CO. 7, Stationers' Hall-court, E.C.

Price Lists on application.

GEORGE ELL & CO.
EUSTON WORKS, 366 and 366, EUSTON ROAD, LONDON, N.W.

PRIZE WAGGONS and CARTS.—HAYES & SON,

Manufacturers to Her Majesty's Board of Ordnance, and all the principal Railways in the Kingdom,

Coach and Cart Wheelwrights, Spring Van and Waggon Builders, Timber Merchants, Contractors, &c.

Manufacturers of Carts, Vans, Waggons, Trucks, and Implements for all Railways, Town use, Agriculture, and Exportation.

Contractors' and Hunters' Dobbin and other Carts, Barrows; Navvy, Excavators', Crowding, and Off bearing ditto, on the shortest notice and of the best materials; &c.

HAYES & SON,
SCOTGATE WORKS, STAMFORD.

GILT BORDERINGS for ROOMS, from 1d. per foot. Best and cheapest House in London for every description of Room Borderings. Picture Frame Mouldings, and Picture Frames of every description, at the very lowest prices. Re-gilding in all its branches to the trade. 2 inch Gilt Beads, 7s. per dozen 6 feet lengths; best ditto, 12s.

GEORGE REES, 57, DRURY LANE
Four doors from Drury-lane Theatre. Established in 1800.

TO BUILDERS AND OTHERS.

TARPAULINS for COVERING WORKS. SCAFFOLD AND HEMP ROPE FALLS. AWNINGS FOR FOUNDATION STONES.

CARY & PRIER,
DE BEAUVOIR FACTORY, SOUTHGATE ROAD, N.

TARPAULINS, MARQUEES, &c. for SALE or HIRE. SCAFFOLD AND HEMP ROPE FALLS.

H. PIGGOTT & SONS,
59, Bishopsgate-street Without, E.C. Manufacturer, by appointment, to Her Majesty's Honourable Board of Ordnance.

GUTTA-PERCHA MILL-BANDS.—The Gutta-Percha Company beg to state that the increasing demand for the Gutta-Percha Strapping for Driving bands, Lathestraps, &c. fully justifies the strong recommendations they have everywhere received. Their durability and strength, permanent contractability and uniformity of substance; their non-susceptibility of injury from contact with oils, grease, acids, alkalies, or water; and the facility with which the only joint required can be made in bands of from 200 to 300 feet long, render them superior to leather for almost all working purposes, and decidedly more economical. Every variety of Gutta-Percha Articles, such as Tubing, Soles, Pump-buckets, Fire-buckets, Bosses, Union Joints, Flasks, Bottles, Bowls, Inlet-trays, Curtain-rings, Galvanic Batteries, Telegraph Trays, &c. &c. manufactured by the Gutta Percha Company, and sold by their Wholesale Dealers in town and country.

THE GUTTA PERCHA COMPANY, PATENTEES,
18, WHARF ROAD, CITY ROAD, LONDON.

The Builder.

VOL. XXII.—No. 1093.

"Going Along." Como. Turin.

A VISIT to Como from Milan, and back, may be made a day's jaunt; and a right pleasant one. An hour and a half on the rail suffices for the journey thither; a steamboat, when the town has been glanced at, will show the visitor the lake, leave him at Cadenabbia, where he may dine and gaze; and will pick him up afterwards to convey him back to the rail, and so again to those Milaners, of whom we have a permanent memorial at home in the name given to every little dressmaker. Travellers who are wise, however, and able, will devote a little more time to the dreamy delights of the place, and will call first at Monza, with its very interesting town-hall or *broletto*; its cathedral, with marble west front; some good brickwork; and rich collection of Mediæval curiosities and metal-work.*

Como, too, the *Comum Novum* of Pliny, junior, who was born there, and calls it his "darling," has a broletto with a front of black and white marble, in alternate stripes, and here and there a little red. The lower story is open, as in the case of many of our old town-halls and market-houses, the upper floor being carried on four pointed arches and columns with sculptured capitals. The window-openings, three in number, above, are semicircular, but have the arch-stones cut so as to give a pointed form on the outer line. Before the centre window is the *ringhiera*, whence the assembled people were addressed, called in common language the *parléra*. We get our word "parliament" from such assemblages as were there addressed, though more immediately from France. The building was finished quite at the commencement of the thirteenth century; but has not escaped meddlers since. The workmanship of some parts of it reminded us that the neighbourhood of Como, in early times, was long celebrated for its masons. Muratori says that even under the Lombard kings, the inhabitants of Como were so superior as masons and bricklayers, that the appellation of *magistri Comacini*, or masters from Como, became generic to all those of the profession. Thomas Hope, who quotes this statement, in his well-known "Historical Essay," connects them with the first associations of Freemasons.

Adjoining one end of the broletto is a lofty square tower without any striking features, unless, meaning no pun, we may except its huge clock; and next the other end is the marble-fronted cathedral, ranging in date over several centuries. The quaint façade of the latter, belonging to the fifteenth century, is noticeable for its pilasters filled with figures in niches one above another, some curious emblematic carvings in bas-relief on the lower part of the fronts, a statue of Pliny with inscriptions, and a very fine rose-window. Within we find a well-vaulted Gothic nave and aisles, and a choir of later date and style; with some good paintings by the delicate-handed Luini, several richly-adorned altars, and two stained glass windows by Bertini, of Milan, of whom we have spoken. Amongst the curiosities of the interior, not its beauties, is a carved figure of the crucified Saviour, having the chin and head covered with a "shock" of real hair,—a shock in more senses than one.

The church of S. Fedele, with a straight-sided arch over the doorway and some curious early stone carvings; and the very old church of S. Abondio, at a short distance off, would reward longer examination than we can give them; but the steamer is ready and we must to the *Larium lacum*, not to settle the site of Pliny's Villa, or to test elsewhere the correctness of his description of the intermittent fountain minutely described by him, but to gaze, breathe, and enjoy. We blurted out in the previous chapter some of the characteristics of the lovely scene, and expressed admiration of the tree-covered mountains on both sides; in one part craggy and precipitous, in another dotted with villas and flower-ful gardens; with here a village and there a convent: the lake smooth as a mirror; the sky a blue field speckless. Everywhere the scenery has a cultivated aspect:—

> "Sublime, but neither bleak nor bare,
> Nor misty are the mountains there,
> Softly sublime -profusely fair;
> Up to their summits clothed in green,
> And fruitful as the vales between,
> They lightly rise,
> And scale the skies,
> And groves and gardens still abound;
> For where no shoot
> Could else take root,
> The peaks are shelved and terraced round."

At Cadenabbia, we said, the traveller may dine. He most certainly *will* do so if wise: and there, not forgetting to taste the "Lachryma Christi" and the "Asti," both excellent at the charming hotel close to the water, he may enjoy the most interesting as well as the most extensive view that can be obtained of the lake; a view commanding the two branches into which it divides itself, with Bellagio at the elevated extremity of the promontory that lies between the two. Here we would willingly linger and dream away the time, garnering up for afteruse,—

> "The harvest of a quiet eye;"

but that would not be "going along:" the steamer has again arrived, and after a hasty sketch of the "lay of the land," we are again *en route* for Como; the sky as serene and the water as placid as before. But this smiling lake is something like a cat's paw; at one moment smooth as a piece of velvet, to be touched not merely with impunity but pleasure; the next, *presto*, a spiky claw not to be carelessly approached. In other words, it is subject to very sudden and very unpleasant outbreaks of ill-temper; and one such on this occasion curled up its surface into foam-crested waves, obliged the sailors to take down the awning of the boat with much noise and flurry, and at the same time sent many of the passengers below, where they lay about the cabin in all the helpless misery of *quasi* seasickness. This was the *avant-coureur*; and, before long, grand masses of purple clouds gathered thickly around, grouping themselves into most fantastic shapes. One, in particular, if we were writing a sensation novel, we should point to as in the form of a floating figure, with long sweeping drapery, head bowed Flaxman-wise, and arms crossed on the breast, as if, while reluctantly compelled to commit devastation, lamenting the ruin it could not avoid causing. Then came the rushing rain; while lightning, first playing magnificently in amongst the mountains, accompanied us all the way back to Milan, and continued to make itself visible and audible far into the night.

The railway from Milan to Turin (out of Lombardy into Piedmont), runs through Magenta, Novara, and Vercelli. Between the first two a pyramidal monument of stone is nearly completed, in memory of the French soldiers who were killed in that campaign for the restoration of Italy to the Italians, wherein the Emperor Napoleon III. unhappily fell off from his intent, and broke his word to Europe. Many dangers has that act brought and is bringing him. At Novara several new buildings are going on. The Cathedral here has an atrium. In Vercelli there are several matters to make a visit profitable. The church of S. Andrea, built about 1218, is transitional between Lombard and Pointed work. Externally it shows a central octagon tower, with two smaller towers at the west end and semi-circular arches. The cathedral is sixteenth century work, Italian. The library here contains, with other treasures, a fourth-century copy of the Gospels, known as the *Codex Vercellensis*. How oddly, by the way, words get fresh meanings. *Codex*, in its Latin sense, was the inner bark of a tree. How comes it, then, now to mean a manuscript? some young reader may ask. For the simplest possible reason. This inner bark was used to write on; and so the Romans got to apply the word to any piece of writing. When we talk of a *codicil*, we scarcely think of a tree, or that in this case, again, the *bark* is the *root*.

Turin is in a state of re-construction, including the interior of our resting-place, the Hôtel de l'Europe. This stands on the fine *place* del Castello, with the old palace and its quaint round red towers to the right, on the other side of it, and in front the Royal Palace, with effective gaseliers on the piers of the gates, enclosing the forecourt of the Palace, and two good equestrian statues—Castor and Pollux. The Gallic tribe, the *Taurini*, who made the city their capital, certainly would not now know it. The streets, with very few exceptions, cross each other at right angles, and continue from one side of the town to the other both ways; so that the snowy Alps or wooded Apennines that everywhere form a background to the city, are seen at the end of every vista. There are many arched promenades, shady avenues, and large and handsome new public gardens without any enclosure. The old public gardens are on elevated ground, covered with fine trees, which is to be lowered, we are told, and built on. This should be avoided, if possible. The area will be needed by and by, and should be kept open. Amongst the new buildings in progress should be mentioned a large station for the Geneva line of railway. Here, as well as elsewhere abroad, inclined planes are formed, from story to story of new works, for the use of the workmen instead of ladders. Granite tramways, we may note, are laid for vehicles throughout the streets, as they are also in Milan. The Victor Emanuel Piazza, opening on the river Po, with the bridge, and the church on the other side, has a good effect. Further on there is a suspension-bridge over the river, dangerously slight. Seen from this ricketty structure, the Royal Palace of Valentino groups admirably with surrounding trees, and, later in the evening, with a star-spangled sky, and a bright crescent moon forming a long pathway of light on the river at its foot, gave us a favourable picture.

The buildings in Turin make no great claims in an architectural point of view. The Cathedral is chiefly rememberable for the Royal Chapel at the end of it, mainly of black marble, designed by Guarini, who was much employed by the reigning monarch in the seventeenth century; but was a poor architect. The roof is formed by a series of flat arches, one upon another, curiously ugly. The large white marble monuments which surround the chapel tell forcibly. One to Francisco T. C. Emanuel I., by G. Gazzini, dated 1849, is particularly good. There is also a very elegant sitting statue of the late Queen, by Salvator Revelli, dated 1854. It was ordered by the Queen herself, and, she

* The present façade of this cathedral, a curious specimen of what has been called expressively the "cabinet style," was commenced in the year 1396, by the architect Matteo di Campione. He was buried in the church, and Gally Knight transcribed his epitaph, still there, as thus,—

"Hic jacet magnus Edificator, Magister Matteus de Campilliono, qui hujus Sacrosanctæ Ecclesiæ fatiem edificavit; Evangelicatorium, et Baptisterium—qui obiit A.D. 1396."

dying in 1855, it was used as her monument. The *pose* is easy, and the drapery remarkably good.

The church for the Protestants, finished in 1853, in sham Lombard style, is very ugly. Still it is a building of cost and importance.

In the Church of the Holy Martyrs, some paintings in fresco, effective and fairly good, have been executed by Signor Goneng. The Church of La Consolata, wherein there is a most curious and heterogenous assemblage of offerings to the Virgin, contains two kneeling figures in marble of Queen Maria Theresa, and Maria Adelaide. The hand of the latter figure over the *prie dieu* is a fine piece of workmanship. A charming little Italian girl, who, attended by her mother, was making a very good painting of this group, seeing that we were examining it whispered modestly, "Both these figures are by Signor Vela." Thanks, Signora. You gave us not merely acceptable information, but a pleasant impression of your own intelligence and grace.

We could not find a better moment to leave off.

PROFESSOR SMIRKE ON ARCHITECTURE AS A FINE ART.*

IN commencing a short course of lectures this season, it is right that I should request you to understand the nature and object of them. To use the exact terms of the constitution of the Royal Academy, it is my duty, as Professor, to endeavour "to form the taste of the students and to instruct them in the laws and principles of composition."

These are terms which you will perceive preclude me from treating Architecture as a practical science; binding me to confine myself to those æsthetic considerations by which Architecture is allied to the sister arts. It appears to have been a part of the original intention of the founders of the Academy, in 1768, that it should comprise a school of architecture in the full sense of that term. In this, as in many other respects, we may perhaps recognize the good sense and sound judgment of our founders.

Their object was clear, simple, and definite; they desired to advance "the fine Arts," and they prudently refrained from comprising within the sphere of their educational curriculum objects of a different nature, such as the theory and practice of mere building must be admitted to be.

However useful it might be to advance practical science, *that* was not their aim; and surely we cannot deny the sound judgment and policy of thus limiting their scope, and leaving mechanical processes to some other school of instruction.

It must be remembered that by far the largest portion of their members, and consequently of their students, *were* as they still *are*, votaries of those sister arts, Painting and Sculpture, from whom it would not be reasonable to require or expect any systematic study of those branches of mechanical knowledge which are so essential for the student in architecture. I do not venture to say that it may not be right, now that the Royal Academy has reached its present state of maturity, that a complete and comprehensive school of architecture should be established within these walls. I do not enter here into that consideration, nor would it be becoming in me to do so. But, certainly as the Royal Academy is now constituted, these lectures must be limited to the consideration of architecture as a Fine Art. Viewed in this light, the art with which I have to do is as much deserving of your study as either of the other sister arts. Perhaps I should say it *demands* your study; for certainly the painter and the sculptor must be regarded as very imperfectly acquainted with their art unless they have rendered themselves fully conversant with the principles of design in architecture. There is one other preliminary remark which is, I think, needed.

Too much must not be expected from these or any other *lectures*. The amount of knowledge that can be verbally communicated by speaking for a few hours during the year, must be slender indeed. General principles and general criticism can alone be dealt with. I may endeavour to illustrate those principles by adverting to examples of admitted excellence, and I may draw further illustration from the contemplation of the errors of licentious or capricious art. But still it is to *principles* mainly that I can here invite your attention. The great volume of architectural knowledge *in its details* must remain closed. Nor should I lead you to expect that that great volume can be mastered by any labours but your own.

The student must be the artificer of his own fortune: the teacher may, according to his ability, arm the student with the appropriate weapons or instruments of his profession,—he may point the way and administer some facilities for advancement; still the art-student must expect progress only in proportion to the toil of his own hands, and to the inspirations of his own genius.

The literary student has, doubtless, as wide a field to cultivate; but *his* labours are wholly mental; whilst the student in architecture has to exercise his hands as sedulously as his head, and to make himself as intimately acquainted with the *material* as with the *moral* elements of his art. He must unite that essential constructive knowledge from which the very name of architecture is derived, with a perception of those graces of form and decoration to which architecture owes its place in the circle of academical fine arts. Our profession is peculiarly complex, and comprises obligations essentially different, — nay, sometimes apparently *discordant*. We have not only to conjure up a thought and express it on paper, but we have also to make it a reality; and in that task we are liable to be embarrassed by a thousand difficulties—of cost, of construction, of deficient material, of limited and prescribed site; a weight of *serious* and *lasting* responsibility lies heavily on us; and we are not seldom sorely tried by those whose tastes we find ourselves called upon at once to submit to and to control.

Such are the difficulties which await the architect, which beset his path with pitfalls and with thorns. But I offer them to your notice with no fear that they will dismay or discourage the real student: to a mind of energy and spirit, difficulties to be overcome tend but to strengthen the resolution and heighten the courage.

The student will ever let it be present to his mind that the study of his profession is no light thing; and he will not fail to enter upon that study with a becoming earnestness and a thorough appreciation of the gravity of his vocation.

I need, however, scarcely remind you that the utmost diligence will be of little avail unless that diligence be wisely directed. That a proper direction be given to your studies is, indeed, absolutely and obviously essential to their future success. There must be no impatience under the restraint of rules: the mind must be disciplined and reconciled to subordination, for he who would command must first learn to obey. Our great master, Reynolds, has said, with his wonted sagacity, "The impetuosity of youth is disgusted at the slow approaches of a regular siege, and desires, from mere impatience of labour, to take the citadel by storm: they wish to find some shorter path to excellence, and hope to obtain the reward of eminence by other means than those which the indispensable rules of art have prescribed."

We often hear "rules of art" condemned as leading to academic coldness, and to a tame, lifeless formality. True it is that no mere rules, no prescriptive teaching, can supply the want of that innate perception of grace, which is not made, but born; which must come uncalled for, if it come at all: but let us by no means be led hastily to infer from thence the inutility of such rules. They will not suffice to give life to a school-copy any more than they will animate a lay figure; yet sound rules of art serve to inspire the best artists with confidence, and, above all, will curb the erratic tendencies of even genius itself, ever prone to overlook the line which distinguishes the bold from the extravagant, the sublime from the ridiculous, even the right from the wrong. Let no student suppose, in whatever amount of conscious strength he may indulge, that he can with safety trust himself to the trackless wastes of his own imagination, and shut his eyes to the lights that have been set up by long experience, or to the landmarks which the *past* has left for the guidance of the *future*. It is a false and vulgar opinion that rules are the fetters of genius. "He who begins by presuming on his own sense," says Sir Joshua, "has ended his studies as soon as he has commenced them." Now, the Orders of Architecture are instances of such *rules of art*, and have been instituted, not as fetters to embarrass, but rather as helps to strengthen, the judgment.

It is no uncommon thing to hear these orders spoken of with disparagement, as tending to inculcate a servile adherence to arbitrary rules, destructive of originality and of inventive talent. I think that this impression is founded on a misapprehension of the nature of these orders; a misapprehension, I am ready to admit, likely enough to arise from the dogmatical tone in which the proportions of the five orders are often laid down.

The truth is, that the artists of ancient Greece in its best days, endowed with an unmatched perception of beauty and of the most refined cultivation, were led by their observation and experience to adopt certain general forms and proportions; and students, struck with their beauty, have sought to trace it back to its original sources by an analysis of those forms and proportions; that is, by their exact measurement and delineation,—a very legitimate, natural, and indeed necessary process.

In thus deducing a system of proportions from the practice of the best architects, we are surely acting as reasonably as the student who would deduce rules of poetical composition from the poetry of Milton or of Pope.

It is thus that the orders of architecture have been instituted; but it is an error to regard them as composing an infallible standard of taste from which any deviation must be heresy. With a praiseworthy adherence to truth, the travellers who have measured and delineated these works, in giving us their transcripts of ancient examples, have figured for our information minute fractions—any hair's breadth—and thankful we should be for their laborious exactness; but it would be a gross mistake to represent that to these fractions we are to pay a superstitious reverence: this was far from the practice or intentions of the great authorities themselves. Vitruvius tells us of the diversity of practice that prevailed even in his own times. In truth, any wide diversities exist even among the best examples.

In the relation of the diameter to the length of the shaft of the Greek Doric order there is a difference of 33 per cent. between the heaviest and lightest examples even in the best times. In the Ionic order a similar, though perhaps not so great, diversity, prevails; and every tyro is aware, also, of the extreme variety in the form and character of the details existing between even pure examples of these two orders. Similar comparisons might easily be multiplied, abundantly sufficient to show that the best masters of classic times held the reins with a loose hand; indeed, under the easy sway of these Five Orders we recognize a regimen so mild as to satisfy any reasonable love of liberty.

The value of these great examples has been not unfrequently tested and proved by the fantastic variations which have been sometimes boldly grafted upon them. In these attempts at new or amended orders, we find little to encourage any wide departure from the parent forms; but, on the contrary we recognize in them more clearly the convenience and wisdom of adhering pretty closely to *known standards*, which the eye has learnt to appreciate as accurately as the cultivated ear distinguishes the intervals of scientific harmony. To set at naught the architectural forms which the age of Pericles has bequeathed to us, is about as idle and undiscerning a task as to contemn the rules of counterpoint, or the musical scale which has descended to us from Guido of Arezzo.

If we turn to the other great system of architecture, that which grew up in the Mediæval period, we shall find artists still acknowledging certain general and leading principles, singularly differing, indeed, from those which guided their predecessors, but still rules of art.

It is true that, so far, at least, as relates to ecclesiastical structures, these rules have been influenced in a material degree by the dogmatic teaching of the Christian Church; which, if it has, on the one hand, inspired many very striking and sublime conceptions, so, on the other hand, it has imposed some restraint on the erratic tendencies of Mediæval genius.

I confess that I am unable to assign to the favourite symbolism of the early Church many of those forms and features which were in truth of earlier growth. We recognize in the Romanesque Church the familiar forms of the Roman basilica, and no ambiguous tendency to Roman architectural decoration; yet we cannot fail to see that a symbolism grafted on pre-existing forms which sought to appropriate and to sanc-

* Delivered at the Royal Academy, January 7th, 1864.

ify the most admired features of Pagan art, did n fact gradually pervade the whole system of Christian architecture, and impressed upon it a character which departed widely from the types of ancient art.

Thus it is that architecture has ever submitted tself to a wholesome control, without imposing any impediments to the exercise of inventive genius. No art has stagnated less than our art; perpetual change has rather been the law of her existence. The student, therefore, as I have already urged, should learn to reconcile himself to the discipline of the schools, and use it as the safest foundation to receive the superstructure of his subsequent education and practice.

An important portion of his preliminary studies should be the acquisition of a comprehensive knowledge of the works of past times. A large and conscientious survey of such works exercises the judgment, forms the taste, and fertilises the mind of the observer, and promotes the growth of new thoughts and new combinations.

Sir Joshua, with his usual felicity says, "The student unacquainted with the attempts of former adventurers is always apt to overrate his own abilities; to mistake the most trifling excursions for discoveries of moment, and every coast *new to him* for a new-found country;" and to congratulate himself on his own arrival at regions which they who have steered a better course have long since left behind them."

Our art has been often subjected to the reproach that it has not advanced *pari passu* with other branches of human knowledge; and it is useless to deny that æsthetics generally have not kept pace either with physics or with the exact sciences.

We must, however, bear in mind that there are important heads of human knowledge which are not in their nature susceptible of indefinite extension, and in which it is idle to expect progressive discovery.

There is every reason to believe that the works of nature supply, and will ever supply, an inexhaustible field for the research of human ingenuity. We can hardly contemplate the time when the facts which lie concealed beneath the surface of created beings and things, will become revealed to all mankind. The Omnipotence that made can alone fully make known the infinite wonders of his own creation. But, as it certainly *is* in morals, so in æsthetics it *may* be, that no new important principles remain to be discovered; and that we can look only for new combinations, for the employment of new materials, and for the discovery of new constructive inventions. A hasty retrospect will, I think, confirm this supposition.

Upwards of 2,000 years ago a more refined and delicate taste, and a more thorough mastery of the power of representing beauty, existed, than the world has since been able to acquire. Nor was that extraordinary æsthetic development confined to a few rarely-gifted artists; for there is not wanting good ground for believing that it pervaded the general mind of the Greek people.

Again, 1,700 or 1,800 years ago, the grandeur of the Roman empire was well typified by a corresponding grandeur of architecture which has never since been equalled.

We find, 1,200 years ago, in the Gregorian chants, musical compositions conceived of a grander character and far deeper feeling than the music of the modern school can lay claim to. It seems to be in accordance with these general views which I have ventured to express in explanation of the *supposed* tardy advance attributed to our art, that a great musical composer of the present day—Rossini—has attempted to account for the admitted want of originality in modern musical composition, by expressing his suspicion, that probably all the material *changes* of which the notes of music are susceptible may have been already *rung out*.

I cannot, indeed, adopt this theory, even in respect of music, and I am still less disposed to damp the aspirations of young *architects*, by countenancing any such doctrine of exhausted originality.

I believe, indeed, that the *fundamental principles* of architecture leave but little room for important future discovery; but the combinations which the component materials of art permit,—their variation, composition, and decoration, are practically infinite and inexhaustible.

May we not discern some relation between the progress of fine art and the corresponding development of the individual man? Our first pleasures are all sensuous,—our earliest efforts are limited to the exercise and gratification of our senses. The eye and the ear are, I believe, as acutely sensitive in early youth as in the after man; it is not until the faculties of the mind are somewhat matured that it begins to discriminate, to survey nature with a more intelligent observation, to take a deeper interest and to recognize a more pregnant meaning, a more mysterious harmony in its forms, its sounds, and its colours.

And so it may be that in the earliest ages of civilization, men mainly cultivated those arts which address themselves to the *senses*.

It seems, indeed, to be conformable with our ideas of the Divine will, to suppose that we should be *instinctively* supplied with the power of enjoying the pleasures arising from these simple elements, whilst purely intellectual pleasures, such as are derived from acquired knowledge and matured experience, are left to be gradually attained by the slower process of self-culture.

These inquiries, however, are scarcely fitted for the present occasion, and must not be here pursued; but the fact can hardly be disputed that not in this country only, but elsewhere, and everywhere in our hemisphere, whatever may be the cause whatever the remedy,—the fine arts—or at least *our* art—has not kept pace with time: and I may add (although I hope that there is no inherent connexion between the two phenomena), that those countries in which, in modern times at least, political and commercial improvements have been most remarkably developed, have been, perhaps, the least fortunate in the cultivation of æsthetic talent.

In this country architects are not unfrequently asked in a somewhat disparaging tone (and the same inquiry may be made in other countries), "What is the style of the nineteenth century? We know with precision the distinguishing style of the eleventh, and of the thirteenth, and of the fifteenth, but what is the style which is claimed as distinguishing the nineteenth century?" This is a question which, I am bound to admit, it is extremely difficult to answer; for buildings from every climate under the sun, and of every period since the Pyramids, are candidates for our admiration, and find spectators willing to be pleased. After making every allowance for the charm of variety, and the monotony of uniformity, especially in street architecture, I cannot but think that the Englishman's claim of right to do what he will with his own, and adopt the style that may seem good in his own eyes, is to be lamented as tending to make our architecture motley, and our buildings incongruous with each other, causing our gables to be of every conceivable angle, and our columns of every imaginable proportion. But so it must be until the republic of taste shall submit to a dictator, or the vision of an eminent writer of the present day shall be realized, who dreams of some happy future, when we shall *all, by common consent*, agree to build in accordance with the canons of the thirteenth century.

But there is another class of enthusiasts with whose views it is impossible not to sympathise. Full of hope and confidence, they watch day and night, in the full assurance that a new style will one day spring up, fresh and bright, from the mint of genius, ready for the current use of the remainder of the nineteenth century.

I have already, in former lectures, said enough to show that I can hold out little hope of such a new birth, or, at all events, that the effort to generate such a phenomenon would be productive of any creditable result.

The experience of all ages shows that the fluctuations of style are the result of causes over which man can exercise but slight control. The varieties of soil—of climate—of available materials, are among the obvious causes of diversity in architectural style: the discovery of a new material, or of a new region,—the requirements of religious, political, or commercial movement: these have been the chief agents that have given birth to those modifications of style which mark the history of our art.

It may not be unprofitable to occupy a few moments in noting some instances of the operation of these external influences.

The style now known as Byzantine owes its origin *not* to the inventive labour of any individual artist of Byzantium, but to the struggles for imperial power in Rome, which led Constantine to establish the seat of his government on the Bosphorus, and so brought Eastern and Western art into *such* combination,—each imbuing the other with many of its peculiarities,—that this *tertium quid*, the Byzantine style, came into existence. Again, the style known as that of the Renaissance is traceable, not to the mere ingenuity of the artists of that period, but to the extraordinary growth of the power of the Turks, who, sweeping before them the degenerate remnants of Roman power, pillaged Constantinople, and scattered its comparatively polished inhabitants over Europe, there to sow the seeds of a taste for classic literature and art. The style of architectural decoration called Raffaellesque, after the great artist who first practised it, really owes its origin not to the inventive powers of that master, but to the eager excavations in search of classical antiquities which led to the *accidental* discovery of the Bath of Titus, the beautiful decorations of which building suggested to Raffaelle their resuscitation. Then, if we turn to another class of architectural design, we shall find that castellated structures, with their lofty towers and frowning machicolations, totally altered their style and aspect, at about the fifteenth or sixteenth century,—not from the caprices or ingenuity of artists, but because some unknown person had chanced to discover the chemical effects of combining in certain proportions, nitre, sulphur, and carbon,—thus totally altering the mode of warfare. If we descend to times nearer to our own, we shall find like examples of the influence of accidental causes over the fate and fortunes of high art. Napoleon, for a while, found it his policy to take imperial Rome as his model, and to obliterate, as far as possible, the reminiscences of the ancient *régime*. Hence Percier and Fontaine, following out, not an æsthetic law, but a political necessity, inundated France, and, by consequence, Europe, with representations of curule chairs and the lictors' fasces; and at once the florid school of Louis XVI. was superseded by the severer forms of classical antiquity.

I might draw further illustration from the ardent revival of Mediæval art in our own days. An enthusiasm which all the labours of a Carter, a Britton, and the elder Pugin, *failed* to kindle, blazed forth at the call-note of archæology,—but of a class of religionists who sought to feed the eye and the imagination with the materials of a more *objective* worship. But, I have adduced enough to show how secondary a part man's *inventive* powers seem to have played in bringing about the revolutions that mark the history of art. He may seek to lead, but he finds himself condemned in no small degree to follow: he may catch the favouring gale, but the helm is held by other hands: he may cultivate, and graft, and train, but the seed has been sown for him.

In saying this, I would not be thought to deprecate individual aspirations to originality; but I would dissuade you from being misled, by the specious cry for *something new*, to tempt the dangers of that wild and perilous pursuit.

Seek rather for that which is *good*, than for that which is *new*, and in this search you may perchance fall in with something *new* which is *good*. The genius of our forefathers has conceived two great styles into which all architecture, as hitherto developed, may be ultimately resolved, the Classic and the Mediæval. These are the two great mines in which you have to work; they are not only not exhausted, but they are practically inexhaustible. They are two systems which, however gradual in their growth, however originally intermingled, have now become perfectly distinct and widely different. Yet both are alike true and simple, both are alike rational and consistent, for both are based, more or less, on the laws of nature and the rational wants of man. The spirit of party, which is apt to enter into most of our speculations where the mind is free, enters somewhat too largely into the republic of art; and architects, as well as connoisseurs, are too apt to range themselves as *partisans* of this or that style. So long as this spirit tends only to promote emulation, and to raise up zealous patrons of art, it is *not* to be lamented; but when,—as such a spirit is apt to do,—it narrows our view, or warps our judgment, the effect becomes injurious to the cause of art and of *truth*.

For myself, I see no reason why both styles should not flourish together in like honour. There is no *monopoly* of *style* in the works of *nature*. She excites our admiration—awes us—delights us—with every possible variety of means; with all the magic of colour, figure, and dimension. From certain laws, it is true, she *never departs*: certain principles are with her fixed and immutable; but beyond those of truth and of aptitude, what bounds does she submit to? She loves to resort to a thousand expe-

dients: she is fain to adopt a thousand different modes of doing the same thing, surprisingly varied. Why, then, should *we*,—though humbly following her, as becomes us, at a remote distance, why should we conceive ourselves under any obligation to adopt as our rule of design one special system? We see *her* expatiating over the whole material world, importing beauty from endless sources. Why should we *run in a groove*, and hold our own to be the only orthodox line in which true taste can be permitted to run?*

VANDYCK IN ENGLAND.

"Most other men, set next to him in view,
Appear'd more shadows than the men he drew."
Cowley, (1641) "*On the Death of Sir Anthony Vandyck, the famous Painter.*"

"Let a man read a character in my Lord Clarendon (and certainly there never was a better painter in that kind), and he will find it improved by seeing a picture of the same person by Vandyck." *Jonathan Richardson.*

THOSE persons alone who have made the writing of Lives a study will best appreciate the labour which the garnering, correcting, sifting, and the right ordering of facts (certain—received or assumed) give at every turn to a conscientious writer of Lives. Nineteen years have passed since I commenced annotating Mr. Carpenter's quarto volume about Vandyck. Nor have I been idle since, or, in some way, unsuccessful. The Public Record Office (thanks to Sir John Romilly) is accessible when good grounds are shown for asking unpaid access. To the Works Accounts of the Accountants to the Crown I had for many years unrestricted access: they were under my care; and from this hitherto scarcely wrought mine I have already contributed "materials" of moment to the columns of the *Builder*. If English history do not become correct to a fault, the blame will in no way rest with the present keepers of the Records of Great Britain.

In forming the Portrait Gallery of the Manchester Art Treasures, I had many Manchester committee disadvantages. The idea was mine; the execution was mine; and I am still proud of the result. I determined to show Vandyck on his throne. Men who preferred to see on canvas

"An ass on the common, a goose on the green,"

to the cavaliers of King Charles, were worsted by what I was able single-handed to accomplish: more examples of "Vandyck in England" were in Manchester in 1859 than will ever be again seen on the banks of the Irwell,—that Fleet Ditch of rivers translated from London to Lancashire.

Every so-called "Vandyck" in England is not a Vandyck. Smith's List is not a Dorling's Correct List. It has been my good fortune to see the Perkin Warbeck Pretender by the side of the True Lion—the Jew's fac-simile on the same counter with the real Koh-i-Noor.

Sir Anthony Vandyck (the famous Fleming among us), is an Englishman. "His works," says Walpole, "are so frequent in this country that the generality of our people can scarcely avoid thinking him their countryman."

Allan Cunningham intended to have added "Vandyck" to a future edition of his Biographies of British Painters. Let us retain Sir Anthony among us, if we can only establish a fair claim to the better half of what he has done. All his honours were acquired in England: he was pensioned, decorated, and knighted by an English king; married a Scottish lady; bore English arms; had his town house in London and his country house in Kent; painted, repainted, and re-repainted portraits of the King, the Queen, their children, and many great personages of the English Court; and, dying among us, was buried, by his own desire, in the cathedral church of St. Paul, in London. This is something, though not all. The better portion of what he has done we have still among us. The critic in art who wishes to study and comprehend Vandyck must go to Windsor Castle, Warwick Castle, Longford Castle, Wilton House, Wentworth House, Stafford House, Montague House, Castle Howard and Combe Abbey, Althorp, Euston, Eaton Hall, Holkham, Petworth, Panshanger, Drayton Manor, to Gorhambury and The Grove, to the National Gallery, and to Earl de Grey's.

The whole Continent can show nothing to compete with our collection. The famous Vandyck of the Louvre is an English portrait. Let us therefore still stand sturdily out in asserting that the greatest portrait-painter the world has ever seen was an Englishman in everything but the accident of birth. Our claim was infinitely less feeble to the throne of France; yet we asserted and made good our right, and only reasserted and made good our right, and only resigned the claim we supported by the sword when it was useless to retain it. We can return Holbein to Basle, Lely to Westphalia, Kneller to Lubec, Gibbons to Rotterdam, Roubiliac to Lyons, and Fuseli to Zurich; but Anthony Vandyck to Antwerp is more than Englishmen will readily consent to.

This thoroughly English artist, the great Lord Clarendon of portrait-painters, was born at Antwerp, in Brabandt, on the 22nd day of March, 1599. Velazquez, the great master of Castille, was born the same year—possibly the same day.* His father's name was Francis, and his mother's maiden name Maria Kupers, or Kuperis. She was his second wife. His first wife, Cornelia Kersbroon, was admired for painting flowers in small, and for needlework in silk. The father was a merchant, and Anthony was his only son. He had sisters: three are mentioned in his will,—Susannah, a nun, in a convent at Antwerp; a second named Isabella; and a third, Catherine, married to Sir Adrian Dircks.†

Anthony evinced a love for art from a very early period, and his father, perceiving the particular direction of his genius, placed him with Henry Van Balen, a painter of name in his day, but now best remembered by the reputation of his pupil, and the portrait he has left us of him. But the fame of Rubens drew him away to a better school, and leaving Van Balen in 1615, he became, in his sixteenth year, the pupil of the great painter whose name is now inseparably connected with his own.

His first employment in the studio of Rubens was in making from pictures finished drawings for engravers to work from. But he soon escaped from this drudgery,—was called to assist his master in something more than mechanical labour; commenced portrait-painter on his own account, and made such attempts in history pieces as attracted the envy, so it is said, of his great master. The tradition of the studios has been that Rubens advised him to confine his attention to horses and human faces. "One of the highest gratifications of superiority," says Hogarth, "to whom we owe the tradition, arises from the pleasure which attends instructing men who do not know so much as ourselves; but when they vergo on being rivals, the pleasure in a degree ceases: hence the story of Rubens advising Vandyck to paint horses and faces, to prevent, as it is said, his being put in competition with himself in history painting." It is more pleasing and probable to suppose that the advice, if given at all, was not given maliciously. Posterity has confirmed the decision of Rubens that Vandyck's strength lay in portraiture and not in history.

While yet a pupil—and a pupil only—in the studio of Rubens, the talents of Anthony attracted the attention of Thomas Howard, Earl of Arundel,—an early and well-known name in the history of art in England. Lord Arundel, it appears, had written to Rubens to request that he would paint for him the portrait of his countess; and to Vandyck, through an agent of his own, "to induce him to remove." The letter to Rubens was delivered by Lord Arundel's agent at Antwerp. Mark the answer, it is all important:—

"Immediately on my arrival in this city, I presented your Lordship's letter to Signor Rubens, the painter, who received and perused it with evident marks of satisfaction. I give you his reply:—'Although,' said he, 'I have refused to execute the portraits of many princes and noblemen, especially of his Lordship's rank, yet from the Earl I am bound to receive the honour which he does me in commanding my services, regarding him as I do in the light of an Evangelist to the world of art, and the great supporter of our profession.'"

The portrait of the countess (Alathea Talbot) by Rubens is now in the Gallery at Munich. Lord Arundel's agent adds:—

"Vandyck lives with Rubens, and his works are beginning to be scarcely less esteemed than those of his master. He is a young man of one-and-twenty: his parents are persons of considerable property in this city; and it will be difficult, therefore, to induce him to remove, especially a he must perceive the rapid fortune which Ruben is amassing."

This letter, a discovery of the present century, is written in Italian, and dated "Antwerp, 17th July, 1620."

That the temptation to remove was made by Lord Arundel, is the conjecture of Mr. Carpenter—a conjecture fully confirmed by a letter from Antwerp, of four months' later date, from the once famous Sir Toby Mathew to Sir Dudley Carleton.

"You will have heard," says clever, conceited Sir Toby in a letter about Rubens and a picture of a chase, "how Vandyck his famous Allieno is gone into England, and that the King hath given him a pension of one hundred pounds per annum. I doubt," he adds, "that he will have carried the design of the 'Chase' into England; and if he have, I durst lay my pair of hands to a pair of gloves that he will make a much better piece than this is for half the money that Rubens asks."

What Rubens asked for his "Chase" (and he confessed it was not all by his own hand), was one hundred Philips and an injured picture of "The Creation," by Bassano, belonging to Lord Danvers. Toby offered him, first, fifty ducats, and then—a little more; but the demands of "the cruel courtier painter," as Sir Toby calls him, were like "the laws of the Medes and Persians [I use Sir Toby's words], and could not be altered." *

Vandyck (that famous Allieno) is now in his twenty-second year, and in England. He was lodged in Drury-lane, with a painter of the name of Geldorp; as nine years later Rubens, when in England, was lodged with Gerbier, a painter living in the Strand. Such, at least, is the tradition which Vertue preserved and Walpole printed. Geldorp was a painter of Antwerp, and a countryman and fond of Vandyck. Gerbier, in a letter to King Charles, calls him that babbler Geldorp "caquetteur." His house in Drury-lane was a "garden-house" belonging to the Crown. Milton, it will be remembered, lived in a "garden-house" in London.

His stay was very short,—that he used his pencil while here we have no evidence; that he rendered some special service to King James I. the Order Books of the Exchequer contain the most positive proof:—

"By order dated xvi of Feby. 1620.
To Anthony Vandike the some of one hundred pounds by way of reward for speciall service by him performed for his Matie without accompt imprest or other charge to be sett upon him for the same or for anie part thereof."

Twelve days later we have this entry in the Register of the Privy Council of the King:—

"28 Feb. 1620-1.
A passe for Anthonie van Dyck gent his Maties servaunt to travaile for 8 months he havinge obtayned his Maties leave in that behalf as was sygnifyed by the E. of Arundell."

Lord Arundel was present at the council when the pass was granted. The wording of it denotes a return to England, and the description of him as his Majesty's servant confirming the gossip of Sir Toby.

And what did Vandyck see in England? A prince of his own age busy forming at St. James's a collection of pictures and works of art which has still, though dispersed, world-wide reputation. A peer of the realm, his patron Lord Arundel, equally busy forming a similar collection, and which, though unhappily dispersed, has still a reputation nearly as extensive as King Charles's. Of his master Rubens he could see but one picture, and that not good. "I could wish," writes Lord Danvers to Sir Dudley Carleton, then the king's ambassador at the Hague and the friend of Rubens, "that the famous man would do some one thing to register or redeem his reputation in this house, and to stand amongst the many excellent works which are here of all the best masters in Christendom, for from him we have yet only Judith and Holofernes, of little credit to his great skill."†

But Vandyck saw more. He saw Inigo Jones busy with a new Whitehall, and that portion of it nearly completed, the ceiling of which his master was to cover with the magic of his pencil, and the walls of which he himself was before long to commence enriching with the fertility of his own.

From pictures executed in England he could learn but little, the works of Hans Holbein and

* To be continued.

* Stirling's Velazquez, 8vo. 1855, p. 25.

† Mr. Carpenter, copying Walpole, calls him "Mr. Dirrick." In the will, as printed by Mr. Carpenter, he is called Sir Adrian Dircke, but in the original will signed and sealed by Vandyck himself, he is called Sir Adrian Direks. A search after this Sir Adrian may possibly throw some light on Vandyck himself.

* Sainsbury's "Rubens," 8vo., 1859. The picture, after some further hustering, was sent to England.

† Lord Danvers to Sir Dudley Carleton, St. James, May 27, 1621. (Sainsbury, p. 57.)

Antonio More and the miniatures of Hilliard and Oliver excepted. Before the accession of King James I. the art treasures of England lay in tapestry hangings, inlaid cabinets, coins and medals, and small objects of ornamental art in silver and gold. King Henry VIII. had the "St. George" of Raffaelle, now in the Louvre. Prince Henry, the son of James I., though but a boy at his death, seems to have had those around him who advised him well, for he had assembled at St. James's a very fine collection of works of art, which descended to his brother, and formed no insignificant portion of King Charles's collection. In the accounts of the Prince's expenses,—unknown to Vertue and to Walpole,—are entries of payments for pictures from Venice and other places, the agent employed by the Prince being the same person, Burlamachi, afterwards employed by his brother in the transmission of his purchases from abroad.

When Vandyck was in England, died in London the most popular full-length portrait-painter of the age of Shakspeare and Bacon. He was encouraged much in the same way that Vandyck was employed and patronized a few years later, as Lely was in the reign of Charles II., Kneller in the reigns of King William and Queen Anne, Hudson in the long reign of George II., as Reynolds was in the longer reign of George III., and as Lawrence was during the regency and reign of the last of the Georges. He was an imported artist, a native of Antwerp, like Vandyck; his name Paul Vansomer. Bacon sat to him for that portrait now at Gorhambury, which, happily, with the "Sic sedebat" statue at St. Alban's, so characteristically preserves to us the features of the great philosopher and lawyer. Full justice has not been done to Vansomer. Nor, as he seldom affixed his name to his pictures, have his works been sufficiently distinguished from the handywork of his contemporaries. With Mytens he is too often confounded; for collectors have failed to observe the truthful remark of Walpole by which their works may be distinguished,—the whole-lengths of Vansomer are commonly placed on a mat, those of Mytens on a carpet. Happily, two of his very finest portraits are to be seen, in excellent preservation, at Hampton Court. He lived (such minute particulars are often of moment) in the Strand, on the water side, next door to Sir Edward Dymock, and dying in 1621, was buried in the adjoining church of St. Martin-in-the-Fields.

When Vandyck left England he left two painters of portraits behind him, both foreigners and both recent arrivals—Cornelius Jansen and Daniel Mytens. Jansen took up his residence in the Blackfriars,—for many years the Newman-street of painters; while Mytens selected the old locality of Vansomer, St. Martin's-in-the-Fields. The latter obtained, and perhaps deserved, the larger patronage.

PETER CUNNINGHAM.*

THE LATE MR. J. J. SCOLES, ARCHITECT.

MR. JOSEPH JOHN SCOLES, whose death in Hammersmith, on the 29th December last, we mentioned, was born in London in 1798. He was educated at the well-known old Roman Catholic school at Baddesley-green, and was articled in June, 1812, to Mr. Ireland, the leading Catholic architect of his day. The revival of the Gothic style was then dawning, and the influence of the Rev. Dr. Milner drew the attention of both master and pupil to this important subject. About the year 1818, chapels were erected by Mr. Ireland, at Leicester, and elsewhere, in this then unfamiliar style; that remarkable antiquary, John Carter, being occasionally consulted for correction of details.

In 1819 Mr. Scoles quitted Mr. Ireland's office, and commenced practice with the erection of a house for Mr. Roberts, at Esher. A few years after, namely, in 1822, he left England to complete his education by foreign travel, visiting the chief continental countries: he also made researches in the Levant and Egypt; and in Syria devoted so much labour to the survey of the holy places, as to have furnished much valuable matter for later authors.† If we mistake not, he had reason to complain in one case that a discovery made by himself had been appropriated by another.

At the end of 1826 Mr. Scoles returned to England, and recommenced the practice of his profession, but he does not appear to have had any important commission till 1831, when he commenced the erection of St. Peter's Church, Great Yarmouth. His other works for the established church were a chapel at Southtown, Great Yarmouth, and a church at Egbaston, erected by Lord Calthorpe. For the Roman Catholic church in England, he erected churches at Stonyhurst (1832), St. John's-wood (1833), Holywell (1833), Preston (1834), Colchester (1837), Newport, Monmouth (1840), Cardiff (1842), Bangor, Merthyr Tydvil, Lydiate, near Liverpool, Chelmsford (1847), Great Yarmouth (1850), St. Helen's (1862). The church of St. John, Islington (1843), provoked some animadversion, which in reply was criticised in the pages of the *Builder* at the time.

The Church of the Immaculate Conception, Farm-street, Grosvenor-square, is the most elaborate of Mr. Scoles's works, and is justly the most popular. He commenced a magnificent church at Prior Park, which was never completed. For the order of St. Philip, he erected a spacious residence, the London Oratory, at Brompton, and connected with it a temporary church of unusual size. In Charles-street, Drury-lane, very large schools were erected by him.

Mr. Scoles was one of the earliest members of the Royal Institute of British Architects, of which he was during ten years honorary secretary, and subsequently vice-president. He was also one of the founders, and since an active member, of the Syro-Egyptian Society.

In recent years Mr. Scoles had expressed a wish that his old pupil, Mr. S. J. Nicholl, should carry out his imcomplete works, which will accordingly be done by that gentleman, in connexion with his partner, Mr. T. J. Willson.

CANONS, IN MIDDLESEX.

THE following notes may be acceptable to Mr. C. H. Smith, respecting the extraordinary building of the Duke of Chandos at Canons. I have never seen any drawings of the house, but in King George III.'s collection of prints and drawings in the British Museum, there are two engravings of the principal façade. They are drawn geometrically, but neither of them has the scale attached. I should judge, however, that the front would not exceed 200 feet in length. This shows two stories, rusticated, within an Ionic order of six half or three-quarter columns in the middle of the front, having three windows on each side, thus making eleven windows on each floor. Above the entablature is a tall attic story, with another row of windows, surmounted by figures over the columns, and a vase at each end over an Ionic pilaster, which finishes each angle of the building. The whole has rather a heavy appearance, and no great merit.

One of the plates is inscribed, "Cannons, in the county of Middlesex, one of the seats of his Grace James, Duke of Chandos, &c. Is most humbly dedicated by his Grace's most obedient humble servant, Joseph Smith. 1731."

The other and better engraved plate is inscribed,—"The South Front of Cannons, in Middlesex, the seat of his Grace James, Duke of Chandos, &c., to whom this plate is most humbly inscribed by his Grace's most obedient servant, John Price, architect. Built anno 1720. J. Price, delin.; H. Hulsbergh, sculpt."

As Lysons states that the building was commenced about 1712, the above plate would tend to show that it was published soon after the completion of the work; but Mr. Smith states that John James, of Greenwich, was the architect. If that be the fact (and Lysons is the authority), what connexion could Price have had with the work to issue a view with such a superscription as would naturally lead one to presume that he was the architect employed? He might have been the deputy surveyor, or clerk of the works. Mrs. Cresy, in the continuation of her translation of the "Lives of Architects," by Milizia, states that James was employed by the Duke "to erect his house at Cannons, where he neither displayed taste nor science." She also gives to him the church at Greenwich; Sir Gregory Page's mansion at Blackheath; St. George's Church, Hanover-square; and the body of the church at Twickenham. These are, perhaps, correctly given; but her statement that the Church of St. Luke, Old-street, is also by James, is not quite correct, as it is undoubtedly by G. Dance. The memoir does not add when he died.

Besides this question of James or Price, I have lately met with a manuscript memoir of James Gibbs, which though not, as I judge, in his own handwriting, has the appearance of having been copied from an original one. In that it is expressly stated that he designed Canons for the Duke. Somewhat in confirmation of this employment, Lysons notices that a bust of Gibbs was existing on the staircase of the mansion at Brockley-hill, near Edgware, formerly belonging to — Sharpe, esq., the secretary to the Duke of Chandos. Perhaps some further evidence may turn up hereafter to decide the question.

I have lately been making inquiries whether there are any original drawings existing by Sir John Vanbrugh. The result hitherto is, that no one remembers having seen any. Such drawings of Blenheim and of Greenwich Hospital as I have seen, are by N. Hawksmoor, who was deputy surveyor at both places.

WYATT PAPWORTH.

THE ARCHITECTURAL ASSOCIATION.

THE BUILDING ACT.

THE usual meeting of members was held at the House, in Conduit-street, on Monday, the 8th inst., Mr. T. R. Smith (the President) in the chair.* The following gentlemen were, on ballot, elected members of the Association:—Messrs. E. W. Cox, J. T. Perry, G. Billington, J. W. Tobin, and L. E. Riddell.

The President directed attention to the drawings executed by their Vice-President (Mr. R. Phené Spiers), for which the Royal Academy had awarded a gold medal and a scholarship for two years.

Mr. Ridge, Secretary of the Voluntary Architectural Examination Class, made a statement with reference to the disappointment and regret which were experienced by himself and others at the non-attendance of members on the last evening appointed for the assembling of the class. Mr. Burnell had promised to read a paper that evening, "On the Strength of Materials;" but finding that the members of the class were "conspicuous by their absence," he of course retired. It could only be accounted for by the severity of the unusual weather and the holiday season.

The Chairman suggested that Mr. Burnell should be invited to read his paper before the Association, at an ordinary meeting, and not before the members of the voluntary examination class only; and this was determined on.

Mr. Mathews read the report of the sub-committee appointed to consider the best mode of improving the library, and making it accessible to members generally. The report contained a number of recommendations and suggestions with that view; and after a short discussion it was ordered to be received, with power to the committee to give effect to the recommendations contained in it.

Mr. C. J. Adams then read a paper "On the Metropolitan Building Act," in which he explained the steps which had been taken by the Legislature, from 1666 to 1856, to regulate the erection of buildings in the metropolis. He entered at considerable length into the provisions of the recent Acts with reference to sanitary arrangements, precautions against fire, ruinous habitations, temporary buildings, exemptions, and the duties and remuneration of district surveyors. In conclusion, he condemned all exemptions. He pointed out Her Majesty's Theatre, in the Haymarket, as a suitable object for legislation in any improved building Act that might be introduced to the notice of Parliament.

Professor Kerr said, in his opinion, one of the weak points in the Act was the administration of it by police magistrates. So defective, indeed, was the law in this respect, that it was merely a matter of time when it should be done away with. One of the oldest and most respectable district surveyors in the metropolis had said to him on this subject, "I will go down on my knees if necessary to ask a builder to alter a work, but I will not bring him before a police magistrate." The police magistrates ought to be made to understand that in these matters they were subject, like the district surveyors, to higher powers, and the Board of Works should be appealed to. As matters now stood, the magistrates virtually set the law aside. With regard to mortar used in buildings, Mr. Adams

* To be continued.

† Supplementary volume to Stuart and Rivett. Ruins at Cadacchio.

* The erroneous date given for this meeting in a recent number came to us officially from the Association.

had produced a sample which was very bad indeed; but it was not so bad as some which he had been invited by Mr. Andrew Moseley to examine. When he arrived at the place, he found a heap of mortar and a heap of garden mould, and specimens of each were laid before the magistrate. The latter declared that he could not distinguish the one from the other: at the same time he was observed to pick something out of one of the parcels, and throw it behind him. This proved to be a worm which had been taken, not from the mould, but from the mortar. There was lime enough to kill the worm, but not to make good mortar. The police magistrates,—who seem to sit as autocrats, and who objected to any interference in the discharge of their duties,—were in the habit of describing the Building Act as nonsense, or, at all events, unintelligible to ordinary comprehension, whereas there was really no just ground for such an assertion. The whole of the practical portion of the Act was contained in a few chapters, which any person of average abilities might master in the course of a single evening. For his own part, he had a great objection to go before a magistrate, as he knew that if at all possible, the decision would be given against him. He did not consider "footings" a weak point in the Building Act, nor did he think that surveyors had any fair reason for complaining against it. There was, however, a hitch about underground dwellings, which he thought operated unfairly so far as district surveyors were concerned. It was not, for instance, fair that surveyors should be called upon at any time to inspect these buildings without any fee or reward. It was also contrary to the spirit of our laws, which inferred that no man was to give his labour for nothing, and which attached responsibility only in cases in which payment was made for work done or duties discharged. He was aware that some surveyors, while keeping literally within the letter of the law, evaded the inspection of underground dwellings in their districts. In his own district, he had got over the difficulty by stating that if the sanitary inspector would furnish him with a list of the buildings, he in his turn would furnish the facts as regarded the application of the Act of Parliament. With regard to detached buildings, he thought the exemption ought not to be absolute, but subject to the approval of the Board of Works. With respect to public buildings, some persons were of opinion that the district surveyor had a discretionary power to enable him to dispense with the provisions of the Building Act. This, however, was not the case; for the district surveyor, although a discreet person, had no discretion whatever, his only duty being to see that the law was carried out. As an instance in point, he might mention that he was applied to some short time since to sanction the erection of a wooden staircase in her Majesty's Theatre, referred to by Mr. Adams. He declined to do so, on the ground that the Act required that such a staircase should be made of incombustible materials, such as stone or iron. The latter, however, were objected to on the ground of expence. The result was that the staircase was not made, and that when he applied as district surveyor for some remuneration for inspecting the premises several times, reporting, &c., he was informed that he was not entitled to anything, because the Act of Parliament contemplated that the district surveyor should be paid only in cases in which works were actually carried out. In this case, therefore, he got nothing, simply because he had discharged, without fear or favour, what he knew to be his public duty.

Mr. Fowler said he could not quite agree with Professor Kerr that the Act of Parliament gave no discretionary power to the district surveyor. In his opinion, the great drawback to the Act was the difficulty of construing it, owing apparently to the desire of the Legislature to make it as brief as possible. This objection especially applied to sanitary regulations.

Mr. E. Nash considered the Act a very excellent one. In his own district of Lambeth he had not experienced any difficulty with the police magistrates, and he had never sustained a reverse when compelled to appear before them. In his opinion, there ought not to be any exemptions whatever, for the district surveyor had as much trouble with such property as with any other.

Mr. Adams explained the nature of district surveyors' charges, and advised young architects to assure themselves that the builder did not charge his employer more than the actual fees so paid, which were in all cases extremely moderate, regard being had to the responsible duties which the surveyor had to discharge.

After some further brief discussion,

The Chairman announced that, on the 22nd inst., Mr. F. C. Penrose would read a paper on "Greek Architecture," and that the next subject for the class of design would be the central hall of a mansion or club-house.

SONNETS CONCERNING BEAUTY.

1st. Objective, is not the result of *subjective*, beauty: for however much the influence of the latter on the former, it is never more than a temporary influence.

WHAT has more beauty woven in its frame
Than this most wondrous mystery, the Soul?
And if from hence the adversary stole
The brightest threads, let Him from whom it came,
Lift but His hand, and 'tis restored and whole.
And when His touch from hence has banish'd shame,
Forth in a flood the inward glories roll,
And all around return responsive flame.
Yet, only with a *transitory* glow,
If their own fulness nourish not the fire.
If flashing lightning kindle gather'd tow,
A moment sees its hasty light expire:
But touch a wood with flame,—the flame shall grow,
Mount high to Heaven in light, and higher yet, and higher!

2nd. Neither is beauty the result of *association*, for while association develops the beauty of the beautiful, it does not create it. The Lord has given beauty to *all* Nature, and has inspired with beauty her servant Art: and beauty such as man may study, not exhaust.

Not in association is the spring
Of all this loveliness our souls admire:
Familiarity owns no such fire
As can ennoble *one* degraded thing.
And if, but him whom watchings never tire,
New wonders still the starry fields shall bring,
They *were* of *old*: nor own his gaze for sire.
So round true Art's, and Nature's doings, bend
Such golden mists of beauty manifold
As man may love, but never comprehend.
With them, then, be familiar, and behold
New stars of loveliness thine heaven ascend;
But as the glorious pageant is unroll'd,
Praise Him, whose tender mercy hath not end!

3rd. Wherefore, TRUE TASTE is catholic; she abides with Art and Nature, and never fails of perceiving their glories,—whether the glory only of the star, or the glory of the sun. All things are her magnificent library: her house is full of beauty and love.

True Taste is catholic. 'Tis not *her* lore
That sets men groping in contracted ways,
Covering some darling splendour aye with praise,
Hiding all else, so that may shine the more.
True Taste is catholic. From mead or shore,—
From days of storm,—from summer's vivid blaze,
Gay childhood's laugh,—brook ripples,—flocks a-graze,—
Athena's face, and Lincoln's minster hoar,—
From limnings, marbles, books, from all* the store
Of wealth which Nature and which Art displays,
Taste doth not turn aside with captious mien,
But more or less of loveliness doth draw
From all by sense or soul discern'd or seen.
She does not call things "common or unclean."

S. C. ROGERS.

THE SHAKSPEARE CELEBRATION.

A MEETING of the general committee, very numerously attended, Mr. Geo. Godwin in the chair, was held on Monday evening last, in the large room of the Society of Arts, when matters were discussed at considerable length. Mr. Theodore Martin, Mr. Hepworth Dixon, Mr. Westland Marston, Mr. R. Bell, Mr. Tomlins, Mr. Durrant Cooper, Mr. Ottley, the Rev. Dr. Vaughan, Sir Chas. Nicholson, Sir Joseph Paxton, Mr. Lucas, and others took part.

We confine ourselves to a mention of the business actually done. It was resolved that four members of the acting committee should be appointed to sit with four members appointed by the general committee, to draw up and issue an address; and Dr. Vaughan, Mr. Shirley Brooks, Mr. T. Martin, and Mr. Tom Taylor, were appointed on the part of the meeting.

Mr. H. Dixon reported that arrangements were being made for holding a public meeting. A deputation had waited upon the Lord Mayor that day, who had promised to reply in a short time to the request for the use of the Mansion-house. He proposed that the Lord Chief Baron, Sir H. Cairns, Mr. C. Gruneisen, and Mr. Deputy Reed, be a committee to arrange all the details of that meeting. The resolution was agreed to.

A monument committee was then appointed, to consist of the Archbishop of York, the Duke of Devonshire, the Earl of Clarendon, the Presidents of the Society of Antiquaries, of the Royal Academy, the Society of British Artists, and the Architectural Museum, the Master of Trinity, the Professor of Sculpture at the Royal Academy, Mr. David Roberts, Mr. Daniel Maclise, Mr. Clarkson Stanfield, and Mr. Godwin.

Mr. Dixon next read a programme proposed by the council for the tercentenary celebration of the birthday of Shakspeare, namely, that the 300th anniversary should be celebrated by laying the first stone of a monument in London. That the committee should use its influence to have Saturday, the 23rd of April, kept as a general holiday. That gold, silver, and bronze medals should be offered for the first, second, and third best poems on Shakspeare. That the foundation-stone should be laid about noon; that in the afternoon there should be a performance of Shakspearean music in Covent-garden Theatre; a performance at Drury-lane in the evening; and that a great *soirée* should be held in Westminster Hall, at which Shakspearean books, prints, and other relics should be admitted.

This programme gave rise to another debate; but it was carried, with the understanding that it was to be looked upon in the light of an instruction to the committee in framing their address.

The meeting was then adjourned till Monday next.

THE BHORE GHAUT INCLINE.

THIS celebrated engineering work, which has been opened by the Governor of Bombay during the past year, deserves a more detailed description than the brief notice which we were able to give it in a late number. We shall therefore condense an interesting account of it given in *The Engineer's Journal* of Calcutta.

The Western Presidency is cut off from the rest of India by the range of the Syhadree Mountains, a volcanic scarp which has been well described as an enormous steppe in the superstructure of the country. Rising on the Bombay side to a height of 2,100 feet at the lowest point of its margin, this remarkable natural obstacle has no corresponding depression on the other side, and simply subsides gradually into the general sea level of the country. Many of the mountain spurs, however, attain considerable elevation, reaching in some cases to 5,000 feet above the sea level. Its distance from the sea coast is about 30 miles; and as it extends, with more or less variation, from Goa to Broach, or between six parallels of north latitude, it has proved hitherto an almost impassable barrier to all trade between Bombay and the interior of the country. The dangerous and almost impassable mountain tracks of the Syhadree range, however, have given place to a now finished railway, and the trade with the interior, which has hitherto dragged its clogged steps by tortuous routes through dense, unhealthy, unpeopled jungles, and over often unbridged, rugged, precipitous mountain roads, now moves over the same ground with as much ease and rapidity, as the provisions of Scotland pass, by the great northern lines, into the heart of London.

The Bhore Ghaut Railway Incline rises almost sharply and abruptly from the plain. In the course of a journey of less than an hour in duration and 15¼ miles in length, the traveller will ascend to a height of 1,832 feet. The highest gradient is 1 in 37, and the lowest 1 in 330; the average being about 1 in 48. A reversing station was adopted with good effect for flattening the gradients. There are in all twenty-six tunnels, the shortest being 29 yards and the longest 437 yards. Fifteen are over 100 yards, eight over 200, and two over 300 yards in length. The tunnels have been mostly cut out of the trap rock, so that they have seldom required masonry. This has largely increased both the cost and labour of the work, however, as it was necessary to mine them throughout. In mining, the work was commenced at both ends of the tunnel with headings about 12 feet wide and 9 feet high, and this operation was followed up by the excavation of the tunnel to its full size.

* All. For do we not divide and classify too much? Why should we, I wonder, separate our life into two parts, and call the *little portion this side of death*, so preeminently life? Is it not calling a symphony the song?

The total quantity of cuttings amounts to 2,067,738 cubic yards, of which the largest contains 113,000. The greatest depth of cutting is 80 feet. The embankments amount to 2,453,308 cubic yards, the heaviest containing 364,300. The total length of viaducts and vaulting arches is 1,330 yards; and of retaining walls 3,640 yards. These walls, which have been required in places where the mountain is too steep to allow of embanking in the ordinary manner, are generally from 30 to 40 feet in height, and are built of substantial rubble masonry.

The construction of this vast work has been, as may well be supposed, attended with difficulties almost at every step. After an unusually heavy fall of rain, for example, about 40,000 cubic yards of a hill side, supporting one of the embankments, slid off the face of the rock upon which it rested, and became stationary about 60 feet below the level of its former position. On another occasion more than 100,000 cubic yards were displaced by the benching being thrust out by the weight of embankment. In the cuttings, masses of rock, termed boulders, have not only fallen away in large masses, but have frequently been found lying in a thick stratum upon sloping beds of rock, from which they have slipped as soon as the cutting was sufficiently advanced.

In the last two working seasons the average number of men employed on the incline was more than 30,000; of whom 10,822 were drillers and 2,659 masons. In March, 1861, this number rose to 42,000. To the liberal arrangements for the comfort of the workmen, as we have before noted, may in a great measure be traced the abundant supply of labour which, at all events for the last three seasons, has been obtained. The rates of wages of all classes below the foreman, varied from 1½ anna to 1½ rupee per day.

A period of eleven years has been occupied in the construction of this great work, at a total cost in money of 1,100,000*l*. The engineer, who designed and nearly completed it, was Mr. Berkley; who, however, has not lived to see the successful termination of his labour; having fallen a victim to an overworked brain in a tropical climate.

CONDITION OF BUCKINGHAMSHIRE.

THE houses in Dinton are, with but few exceptions, in a more dilapidated state than any we have mentioned: the want of "conveniences" is most objectionable; and even the few which are provided are placed in the most injudicious situation. Take one for instance, which, with its poisonous cesspool, is immediately below the only window of one of those small sleeping-rooms to which we have referred. The piggeries are also in dangerous proximity to the dwellings. In the summer time especially, when the greatest care is needed, refuse of various kinds is allowed to collect in heaps, until it is convenient, in the autumn, for those who have small plots of garden-ground, or the farmers, to collect it for use.

The plan which is generally followed, of keeping what is intended for manure carelessly strewn about, instead of being carefully covered up, causes an unnecessary pollution of the atmosphere, and also renders the manure of comparatively little value. Here, as elsewhere throughout this district, the surface drainage of the villages is neglected, notwithstanding that good farmers find it to their advantage, as regards the value of both their cattle and crops, to drain well. In this important matter human beings, in these places, seem to be entirely overlooked. There are some cottages in which a kind of external restoration has been made: this consists of a flat layer of plaster over the rough surface, marked with lines in imitation of masonry. This disguise, however, soon falls off, and shows the original work, which is of a most rotten description. The walls, which are often of a thickness of from 15 to 18 inches, have been planted without preparation on the ground: up to the height of 2 or 3 feet limestone is mixed with a sort of muddy concrete, of which the remainder of the walls is entirely composed, except in some instances where timber framework is partly introduced. This concrete seems to have been chiefly formed of the light-coloured mud which abounds, mixed with a little lime and gravel: it is so soft that it crumbles with the slightest touch, and is so porous that it absorbs water and impurities almost as readily as a sponge. A specimen of this kind of construction was shown in a recent number of our journal (vol. xxi., page 897), where there are some other illustrations of the Dinton dwellings.

Anything more dreary and neglected than the group of dwellings shown in the adjoining engraving could not readily be imagined, and the rear of the premises is even worse than the front. We will give a view hereafter to show how the piggery is often situate in connexion with the house; but we have been forced in the sketch to throw down the wall of the pig-sty in order to show the animals. Actually there is only a small door-way, which was closed. The rain had been pouring through the thatch, which was falling to pieces: in the little room adjoining this place was the fire; and notwithstanding that this burnt brightly, the walls, hearth, and brick floor were soaked with damp; the fire seeming, instead of drying, to attract the moisture from the piggery and adjacent parts.

A casual observer would think by the outward appearance of many of these cottages that the interior cubic space of the rooms was far larger than it actually is; but it should be considered that when a depth of 18 inches for each mud-built wall is taken from the internal space, the interior extent is greatly diminished; and the high-pitched roofs are also deceptive, for little of the large space is added to the area of the upper rooms, as the pent is stuffed with thatch, supported on rafters, which are but slightly raised in pitch above the square.

Some of the houses at Dinton are about a century old, and others are of greater antiquity. Bad as is the condition of these homes, the dwellers in them, although they are for the most part aware of the evils, and complain grievously, would not know what to do if they were removed; there being much difficulty in obtaining even this miserable kind of shelter at a place near where the people are employed; and this suggests two or three matters of objection, which have been made by certain landowners against the erection of groups of cottage dwellings. There is, for instance, the question of the poor-rate, to which we have already referred: it is also stated that the drainage of houses thinly spread over a considerable surface would be much more expensive than in small towns, where the population is more compactly gathered together, and that it is therefore better for the people themselves,—even if the distance be greater which they have to go to and from their work,—to live in communities sufficiently numerous, placed in good positions, where the houses might be raised and drained at a cost that would be remunerative. There is much in the observation which is worthy of careful thought. As regards the latter point, we think that, provided the law of settlement were abolished, we should find villages of a greatly improved kind rising up, especially on the larger estates, on which it is an undoubted duty for the landowner to provide decent and healthy homes for those who are employed upon the land; and the same may be said in a proportionate degree respecting all landlords. However, as the law now is, few are willing to grant ground or incur the expense of building at a slight profit, and at the same time saddle their estates with a largely increased amount of poor-rate: this is not a philanthropic way of putting the question, but it is the common sense and truth of the matter.

In Dinton the miserable cottages, some with a piece of garden attached and some not, let at a yearly rental of from 3*l*. to 3*l*. 10s.: from 3*l*. to 4*l*. is the usual rent for two-roomed cottages throughout this district. When looking at the neglected condition of parts of this property it was with surprise we learnt that it belonged to Lady Franklin, well known far and wide for her devotion to an idea, and for her kind disposition: we were told, however, that the lady does not personally visit this property, but that it is left in the management of an agent, who is regardless of complaint. We think that if Lady Franklin were to make a personal inspection a beneficial change would be effected here.

It is to be noticed, both at Dinton and elsewhere, that where the dwellings have been allowed to fall into decay, there a proportionate want of care is shown in the keeping of the interiors: the flowers in the windows fade, and if you look into the garden, you see—

"The wild briar,
The thorn, and the thistle growing broader and higher."

So it is that the state of the homes materially affects, not only the health, but also the social condition of the inmates, leading on from bad to worse.

A rough walk of about three-quarters of a mile through wet newly-ploughed fields brings us to Gibraltar, a strange name for a place in this situation. We endeavoured without success to discover how the name originated. Here is a small roadside inn; and beyond this, at a short distance down a lane, is a small group of cottages: some of these are on one side of the lane, and five or six others stand at right angles in small gardens. The general appearance of these houses is not worse than that of those in many other villages in this district: the cottages are in better general repair than those at Dinton. Notwithstanding, it was here, fourteen years since, in the month of August, that cholera attacked every one of the dwellings, and carried off a chief part of the population; the remainder seem to have been saved by removal to tents erected for their reception in the neighbouring fields.

In one house, an entire family, consisting of father, mother, and five children, all died; and not one dwelling escaped visitation. A woman who still lives here in the same house in which her husband died of this cholera attack, and who had some of her children sick, says, that the scenes were terrible: the bodies were removed directly after death, and on some days five and more coffins were carried from this small hamlet. There is no doubt that the little ill-ventilated rooms were a means of rendering the disease much more fatal than it would otherwise have been: the effluvium in the houses, especially in the sleeping-rooms in which cases of cholera were, was almost unbearable; and neighbours in attendance upon the sick were infected by the concentrated poison of the air of the apartments. With great rapidity the pestilence passed from house to house, and it is reported that for some days before the first case occurred, an extraordinary and sickly smell was perceived throughout the village, but no one seems to have noted the particular cause, nor could we learn satisfactorily if there had been any removal of manure from the place, or if any had been cast upon the adjoining fields. Neither does there seem to have been, so far as we could learn by careful inquiry on the spot, any express cause for the outbreak: there was, however, then, as there is now, sufficient sanitary derangement to account for it.

A chief cause is the overcrowding of the rooms: most of these are of similar dimensions to those referred to in the last paper, viz.,—room on the ground, 12 feet long by about 7 feet wide, and less than 6 feet high; the sleeping-room above only 5 feet. And outside, the evil is added to by the neglect of drainage. At the back of some of the cottages there is a large field, which rises by a very gentle gradient for a considerable distance: this is a cause of dampness; for sometimes in rainy weather there is water to the depth of from ½ to 2 feet lodged against the walls. The want of a sufficient number of privies, and the disuse of even surface drains, cause dangerous matters to be left in large quantities close to the doors and windows; and as the cottages are a hundred years old or more, there must here have been absorbed into the soil a large part of the refuse of three generations of tenants. So, likewise, the water from the ill-walled well must be constantly polluted, especially after rain, by the impurities which must drain into it.

Here, and in other parts, where the homes of the labourers are of a similar description, we find in the faces of the children pale and cadaverous tints, instead of the rosy hue of health, and frames weak and attenuated, which in better circumstances would be robust and active. We noticed also many cases of skin disease; but, much as the children seem to have suffered, the mothers of families appear to have fared worse. In one house here, a man of much intelligence said, "How can we expect to be better, pent up in this box? There sits my wife, sir: what age would you take her to be?" Being naturally anxious to evade a delicate question of this kind, we did not express a clear opinion, or give a direct answer to the query, of "how much older do you think she is than fifty?" It appeared, however, that this woman was only thirty-three years of age, although, if we had given a candid opinion, it would have been that she had lived for upwards of half a century. We found many similar instances.

The basement rooms at Gibraltar, notwithstanding that fires were lighted, felt cold and cave-like, and the air was adulterated with a damp, deadly smell, similar to that met with in ill drained and badly ventilated churches when the vaults have been well filled. In one of these apartments was a woman, as careworn as most of the others in similar situations, who was working at cushion lace-making, a beautiful

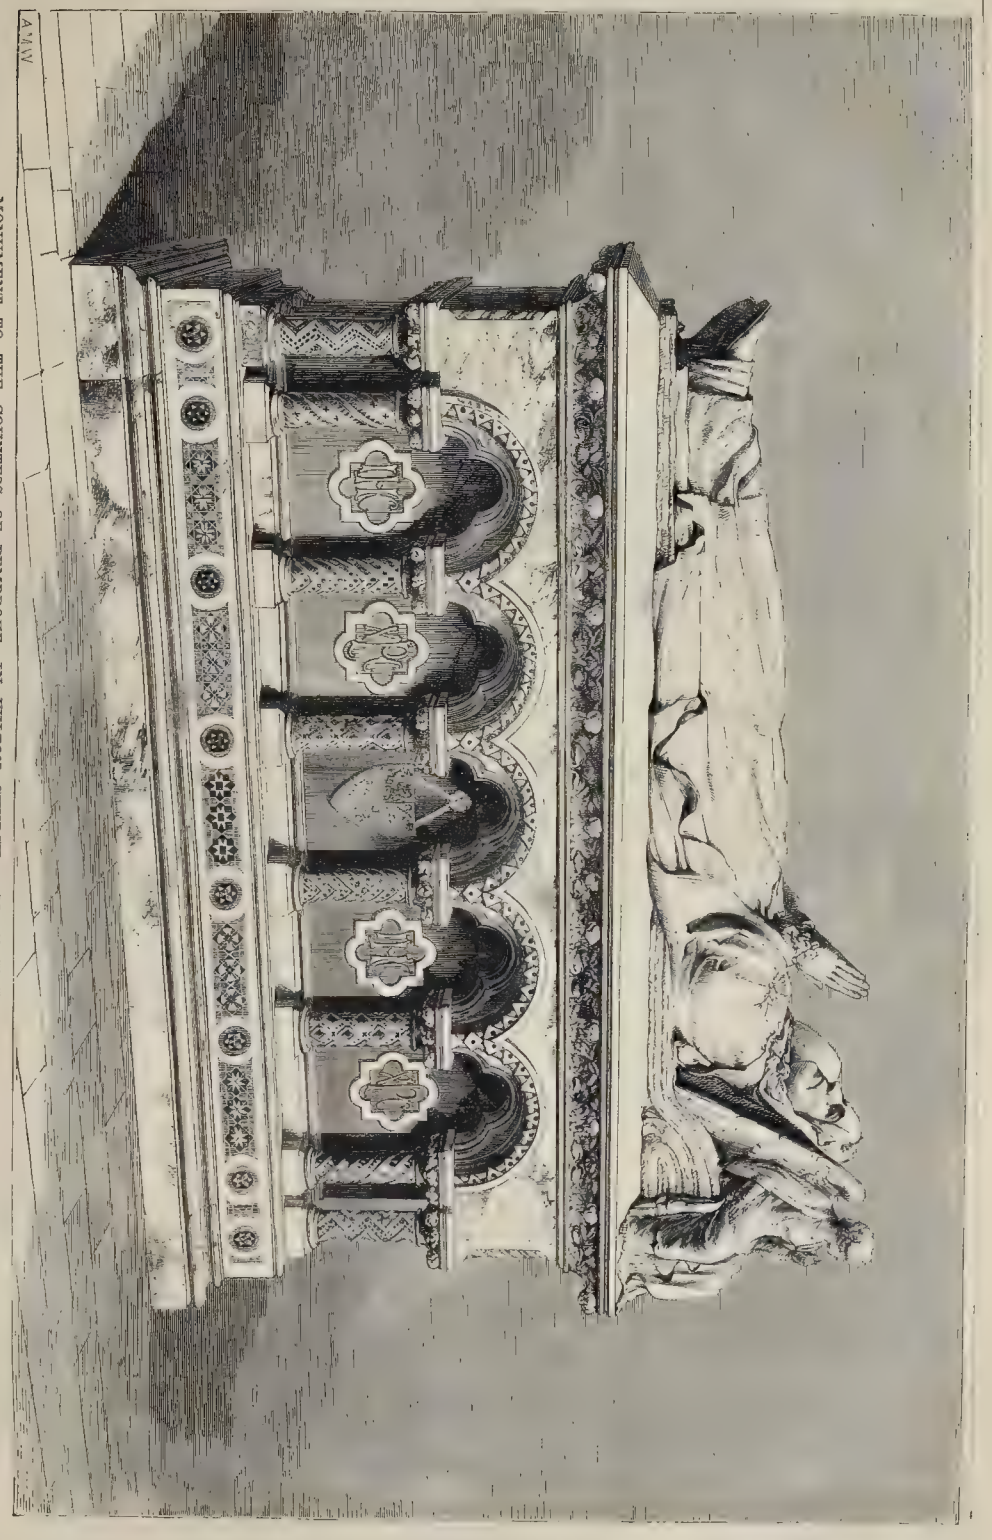
THE COTTAGES OF BUCKINGHAMSHIRE.

MUD COTTAGES, EDDEESBROUGH. EACH A SINGLE ROOM.

COTTAGES AT DINTON: CLOSE AND CONFINED: BAD DEPOSITS AROUND.

kind of work, which twenty or thirty years ago was a very remunerative description of employment, and occupied a large number of women and girls, in Buckinghamshire, Bedfordshire, and Hertfordshire. This labour is now so ill paid that it is scarcely worth the while of the most skilful hands to devote their time to it: bonnet straw cutting and plaiting have, however, come into use as branches of female employment.

In other rooms the children were huddling together within the recess and around the open fire-places, in which the fire-dogs were in use in the same manner as they were eight or nine hundred years ago. It was pitiful to see pale and delicate infants in those cold, damp interiors. Inspection shows it to be out of the question generally to use these basements for sleeping; and this drives the families into the rooms above. The open fire-places and wide chimneys are useful for ventilation: less of the heat is wasted than in most of the modern fire-grates; and although the wind was at times howling in the wildest manner and sounding through the telegraphic wires like a monster Æolian harp, and whirling among the tree branches with a pressure of upwards of thirty pounds on every square foot, there was but little complaint of smoky chimneys.



Inland coal, brought by railway and the Union Junction Canal, to Aylesbury, and by the canal to other places, can be had at from 18s. to 20s. a ton, a price which is increased in proportion to the distance to which it is necessary to carry it by horse and cart from the depots; but most of the poorer people who have accommodation for the purpose store up a quantity of wood for use in winter. Several persons of whom inquiry was made, reported that the wages of men employed upon the land were very small, often not averaging throughout the year 8s. for each week: but there are, as has been mentioned on other occasions in the *Builder*, in the country, means by which the small stipend can be increased; for instance, the mother may be able to earn a little; the children can be put early to work; and it is more easy for the girls of well-conducted families to find places in service than it would be for those of the poorer and industrious class in Bethnal-green and other metropolitan districts. But the bright winter sun is getting low, and it is time to wend our way again to Aylesbury. At Hartwell a singularly large flight of rooks was whirling in a thick black cloud in the neighbourhood of this house. A sage-looking rustic doubted if those black birds did most good or mischief, and whether agricultural produce or destructive insects were the most largely consumed. We must take another opportunity to finish our notes.*

* With reference to a note in our previous article on Buckinghamshire, mentioning the death of Mr Hedgkins, who had planted many of the trees about Aylesbury, we are asked to mention that his pupil, Mr. J. C. May, may be viewed as his legitimate successor in that department.

MONUMENT OF THE COUNTESS OF PEMBROKE; WILTON CHURCH, WILTSHIRE.

Two handsome monuments have lately been placed in the parish church of Wilton, in memory of the late Lord Herbert of Lea, and his mother, the Countess of Pembroke. The design of these monuments is by Mr. T. H. Wyatt, the architect of the church. The effigies have been designed and modelled by Mr. J. B. Philip, sculptor. They are sculptured with great skill, and being good likenesses, will be deeply valued by the congregation of that church to whom the originals were so endeared by untiring acts of benevolence and friendship. The effigy of the Countess of Pembroke is executed in Pentelic marble, that of Lord Herbert in Carrara marble. The tomb is chiefly of alabaster, mixed with marbles of various colours, and enriched with mosaic work panels. Round the top of each monument is a brass containing inscriptions. The monument of the Countess of Pembroke has been erected by her children, that to the memory of Lord Herbert by his widow. These monuments form interesting adjuncts to the church.

TO CLEAN MARBLE.—Mix together two parts of common soda with one part of pumice and one part of finely powdered chalk; sift through a fine sieve and mix some of this powder with water, rubbing it all over the marble, or over the stained parts; then wash it off with soap and water.

MONUMENT TO THE COUNTESS OF PEMBROKE, IN WILTON CHURCH.—MR. T. H. WYATT, ARCHITECT; MR. PHILIP, SCULPTOR.

SIR STAFFORD NORTHCOTE ON ART EDUCATION.

IN speaking on this subject, at Exeter, Sir Stafford Northcote said:—Education in drawing conduces to make men certain and correct in what they do. It induces them to do that in the general education which writing does in their intellectual education. It conduces to make what a man does know certain. How often do we see that a man, if you explain anything to him, thinks he understands you, and that he would perhaps give you a tolerably good answer if you put questions to him; and yet if you ask him to write down the matter upon which you have been discoursing it appears that he does not thoroughly understand it. Just in the same way is it with drawing. A man takes notice of an object, and, thinking he knows all about it, goes away. But if he tries to draw it, then he finds there are many points of it which he had not noticed, or of which he has taken an incorrect impression. Drawing, therefore, gives a man correctness of observation, which is one of the most valuable qualities of education. This view is confirmed by the opinion of others who are better able to judge than myself. I was very much struck, not long ago, in the course of an inquiry which I and others have been carrying on as to the public schools of the country, by the answer of the very distinguished headmaster of a very celebrated school. He was asked, with regard to drawing, whether it was taught in his school. On his replying that a number of boys had learnt drawing, he was asked whether he had found that the boys who had done so were in any way assisted in their classical studies by it. That was a question which seemed rather curious at first, because it was thought that drawing might take them from their classical studies. The answer was that he had not the slightest doubt they were assisted in their classical studies, because it enabled them to realize to themselves many of those things of which the classical poets wrote; that they were accustomed to draw from descriptions or from pictures which were set before them; and that they thus obtained a much more accurate knowledge than others not able to draw. That is the case with all those studies which conduce to greater accuracy of observation; they improve the mind—they improve the intelligence of those who prosecute them.

FRAUDULENT TRADE MARKS.

ON the 1st of January, the Merchandise Marks Act came into practical operation for the first time. This statute makes it a misdemeanour to forge or counterfeit any trade mark, or falsely to apply any such trade mark, with intent to defraud, whatever the article to which it may be applied, whether it be a cask, bottle, stopper, vessel, case, cover, wrapper, band, reel, ticket, label, or any other thing in or with which any commodity is sold, or intended to be sold. Again, it is from henceforth an offence for any one to sell or expose, either for sale, or for any purpose of trade or manufacture, articles with forged or false trade marks attached, the penalty being the forfeiture of a sum of money equal to the value of such articles, and a sum besides, not exceeding £5 nor less than 10s. By another provision, every addition to and every alteration and imitation of any trade mark made with intent to defraud—the intent being of the essence of the offence in all cases—are to be deemed forgeries, and punishable as such—namely, in addition to the penalties for misdemeanour, by the forfeiture of every instrument used for the purpose of the fraud, and of every article to which such false mark shall be applied. It is made obligatory on every person who shall sell an article having a false trade mark to give information, on a demand in writing being made upon him as to where he procured it; and power is given to Justices of the Peace to summon parties refusing or neglecting to afford such information; and, in the event of their persisting in their neglect or refusal, to impose a penalty of 5*l*. Further, to mark any false indication of quantity upon an article with intent to defraud is made punishable by a penalty equal to the value of the article and the payment of an additional sum not exceeding 5*l*. and not less than 10s. A conviction under the powers of the act is not to affect any right or civil remedy, to which any person aggrieved may be entitled at law, in equity, or otherwise; nor in any indictment, information, or proceeding under its provisions, need an attempt to defraud any person in particular be alleged or proved. The punishment, on conviction of any offence, which by the act is made a misdemeanour, is to be, at the discretion of the court, imprisonment for not more than two years, with or without hard labour, or by fine, or both by imprisonment, with or without hard labour and fine, and also by imprisonment until the fine (if any) shall have been paid and satisfied. There is a clause according to which the vendor of an article with a trade mark is to be deemed to warrant or contract with the purchaser that the mark is genuine, unless the contrary shall be expressed in some writing signed by or on behalf of the vendor and delivered to or accepted by the purchaser. The seller of an article, too, with a description upon it of its quantity, is to be deemed to contract and warrant that the description is true, unless as before, the contrary shall be expressed in writing delivered to and accepted by the buyer.

THE WEAR DOCK CONTRACTS.

AT the last monthly meeting of the River Wear Commission, at Newcastle-upon-Tyne, the Executive Committee reported that they had received the tenders for new dock works, but found them much higher than was anticipated, the contractors having evidently put on a large sum for sea risks. For the proposed Hendon Dock and entrance they had received seven tenders, varying in amount from 238,987*l*. to 161,458*l*. They advised the rejection of the whole of these tenders, as they were satisfied the work could be done for a much smaller sum. If the commissioners carried out the work themselves in detail, by contract, a large sum might be saved.

The Engineer said, his original estimate for the work was 85,000*l*., and he was still satisfied that it might be done for that amount in the way indicated in the report.

After some discussion the commission resolved to carry out the works themselves, employing small contractors under them.

The committee reported, that for the solid inner pier on the north-east side of the sea-outlet, they had received eight tenders, varying in amount from 48,079*l*. to 19,447*l*. These estimates, they also considered, were much higher than the work might be done for, and they recommended that the tenders should be declined. The engineer had prepared another plan and model, according to which it could be accomplished during the ensuing season, at a cost of 12,000*l*., so that by this plan a saving of 8,000*l*. would be effected. They also recommended that the commissioners should do the work themselves. This also was agreed to.

The committee reported that they had received fourteen tenders for the construction of the new graving dock, varying from 32,234*l*. to 14,277*l*., and they recommended that the tender of Mr. Hurst, amounting to 14,375*l*. be accepted.

There had been only two tenders for the caisson, but they recommended that both be declined, as they were considered too high. They would take steps to have the work done in some other way. The lowest price was 3,384*l*., but they considered the work might be done for 2,500*l*. This portion of the report was also adopted, and the committee were authorized to proceed at once with the work.

THE PROGRESS OF BELFAST.

THE flax trade, which is in a flourishing condition at Belfast, has of late years led to a great increase in the buildings of Belfast. The growth during the past year, according to the *Newsletter*, has been especially rapid. The total number of new houses included in the valuation was 1,260, or 420 more than in 1862, the increase being exactly 50 per cent. The increased value of the new buildings in 1863 over 1862 was nearly 50 per cent., the figures being, for 1862, 7,618*l*., and for 1863, 10,408*l*. The total valuation, which at the close of 1860 was 270,930*l*., increased in the years 1861, 1862, and 1863 nearly 10 per cent., or about 26,000*l*. A considerable number of new houses are also in progress, which cannot be valued until next October. The increase on the County Down side of the river is especially great. With the exception of five houses valued at 23*l*. in Ballynafeigh, it is confined to Ballymacarrett, in which, therefore, within the year, 200 new houses were erected, valued at 1,167*l*.; and there will probably be a still further increase in 1864. The opening of the bridge, the removal of many destitute families, and the wide-spread employment which is being given, have all contributed to this improvement in Ballymacarrett. According to the census of 1861 there were in the borough 18,100 inhabited houses. There were, of course, many stores, warehouses, and other buildings not coming under that denomination; and the total number of buildings of all classes was probably about 20,170. If to these we add the 2,860 buildings since erected, we have a total at the present time of 23,000.

COMPETITIONS.

Rochdale Town-hall—The Town Council of Rochdale have decided upon the erection of a town hall, at a cost, for the shell of the building, of 20,000*l*. Prizes of 100*l*., 60*l*., and 40*l*. are to be offered for the best designs.

Pitsligo Union Chapel.—In answer to the advertisement of the guardians for design; for a new chapel, proposed to be built on a piece of ground adjoining the Union House, twelve sets were sent in, from which the committee selected a design prepared by Mr. Robert Hutchinson, architect, Huntingdon, and appointed him to carry it out.

GAS EXPLOSIONS.

A SEMI-DETACHED villa, No. 21, Tollington-road, Holloway, has had its front completely blown out by a gas explosion. The two adjoining villas, as well as Nos. 10, 12, 14, 16, 18, and 20 opposite, some 60 feet across the road, had a greater part, and some entirely all, of their windows smashed. The gentleman who occupied the house and his wife are severely burnt. It appears that on entering the front parlour with a light to see if all was safe before retiring, Mr. Byrne was suddenly thrown down, his light having exploded the gas which had been allowed to escape from the chandelier.

An explosion has occurred at the City Gas Works, Whitefriars, causing the death of a workman. At the inquest Mr. Mann, superintendent of the works, said that the hydraulic room was a well by the side of the gas-holder. The gas-pipes passed through the well for the purpose of entering the gas-holder. There was generally water at the bottom of the well. The well was covered with iron. There were two doors at the top of the well for the purpose of enabling the well to be examined. The gas-pipes were obliged to be covered with water before they entered the gas-holder. The well doors were always kept closed to prevent the entrance of air. After the explosion the doors were found to have been blown open. There was a pump down into the well. In the opinion of witness the explosion was caused by the mixture of gas with atmospheric air in the well. He had made inquiries and could not find that any one was in the well that day. In his opinion there was no leak in the well. The top of the well was used as a thoroughfare. For some days previous to the explosion a pail containing burning coke had been kept at a distance of 4 feet 6 inches from the pump down into the well, and it was so placed because the pump was frozen. He did not think that any of the lighted coke had come in contact with the gas in the well.

Faulkner, a labourer, said that a piece of the lighted coke in the pail might have been thrown upon the iron doors of the well. In those doors there were two key-holes. Through those holes a slight escape of gas might have taken place, and so have become ignited. In future there were to be no fires lighted near the pump.

After some further evidence,

The jury returned the following verdict:—"That the deceased was killed by a certain explosion of gas, but how the said explosion was caused there was no evidence to show."

NEW STABLES, LYME HALL, CHESHIRE.

THESE stables are being erected for the owner, Mr. W. J. Legh, M.P. The building is rectangular on plan, the various apartments being arranged round a courtyard, 72 feet long by 67 feet wide. There will be accommodation for twenty-two horses, all (with the exception of four stalls) being loose boxes, formed by walls of blue bricks built up to 4 feet 6 inches above the floor, and

finished with an ornamental iron railing. The wall in front of the horses' heads will be lined with light buff-coloured glazed tiles to a height of about 3 feet, having bands of chocolate-coloured tiles running the whole length of the range of boxes. The building also contains coachman's dwelling, coach-houses, harness-rooms, cleaning-rooms, and apartments for stablemen and grooms. The material is stone, procured on the estate, known as the Parks Moor stone, and backed up with brick. The style is Italian, in keeping with the Hall, and the total cost will be about 5,000*l*. The building is being erected from designs and under the superintendence of Mr. A. Darbyshire, architect, Manchester, Mr. T. Howard acting as clerk of the works.

On New Year's Eve Mr. Legh gave a dinner to all concerned, including about 130 workmen engaged upon the works.

THE WORKMEN'S CLUB MOVEMENT.

A NUMEROUSLY-ATTENDED public meeting has been held in Kennington for the purpose of promoting the establishment of a Southwark Workmen's Club. Mr. A. H. Layard, M.P., occupied the chair; and appropriate resolutions promotive of the object in view were unanimously passed.—The opening of the Bristol Working Men's Club and Institute has been inaugurated by a public meeting in the lecture-hall of the Institute, in College-place.——A public meeting has been held at Yeovil, the mayor in the chair, and several of the employers and a large number of working men present; when the Rev. H. Solly explained and advocated the principles and objects of the movement. Resolutions in favour were enthusiastically carried.——At Bridport, in the Town-hall, a meeting has also been held, and Mr. Solly there also delivered an address to the Working Men's Association.——A working men's club has been successfully opened in Preston, called the "Central Working Men's Club." The building comprises a kitchen for cooking, refreshment-room for non-members, large news-room, business-room, class-room, bagatelle-room, and smoking-room, and three other rooms for amusement, such as chess, draughts, dominoes, &c. In connexion with these premises there is a gymnasium, consisting of giant stride swing, inclined ladder and plank, horizontal bar, parallel bars, vaulting horse, high leap, climbing-pole, hand-swings, skittle-alley covered in, nine-pins, dumb-bells, &c., &c. There are now more than 400 members, and this number will make the club self-supporting. The members can be furnished with refreshments in all the rooms except the news-room. Working men in Preston need no longer go to the public-house for recreation, unless they desire to do so.

STATUES AND MONUMENTS.

THE statue of Oliver Goldsmith, by Foley, in front of Trinity College, Dublin, was inaugurated, on the 6th inst., in the presence of Lord Carlisle the Lord-Lieutenant, and of the Provost of Trinity College, and a distinguished company of members of the learned professions, together with a large assemblage of the citizens. The Lord-Lieutenant, in his address, said,—Here we contemplate a genius, of which no more accurate or pithy summary can be given than in the words which his great friend, Dr. Johnson, inscribed upon the stone which bears his name in Westminster Abbey—"There was no style of composition which he did not essay,—none he essayed which he did not adorn;" but of so much variety and so much excellence, if I were called upon to select the most striking specimens, I should naturally name "The Deserted Village," "The Traveller," and above all, perhaps, "The Vicar of Wakefield." Why, the walls of the Royal Academy of England would not know themselves if a single year came round without exhibiting a subject from the "Vicar of Wakefield." Still, novelist, historian, satirist, essayist, dramatist, as he was, it is mainly as a poet that we represent to ourselves Oliver Goldsmith. If I were to search for an adjective by which to distinguish his poetry, I do not think I could find one so fitting as exquisite: others have soared to greater heights, and shed intenser light, in the poetical heaven; but where was ever combined more perfect rhythm, more mellow harmony, more refined simplicity, more graceful truth? Short as my limits must be, I would justify my praise by the most convincing process I could use; by recalling a few notes of the music of his strain to your, I feel sure, not unaccustomed ears. Take the decline of a virtuous old age,—lines I once heard with singular effect applied by Lord Brougham to Mr. Withergere:—

"For him no wretches, born to mourn and weep,
Explore the mine, or tempt the dangerous deep;
No surly porter stands in guilty state
To spurn imposing famine from the gate;
But on he moves to meet his latter end,
Angels around befriending virtue's friend;
Sinks to the grave with unperceived decay,
While resignation gently slopes the way;
And all his prospects bright'ning to the last,
His heaven commences ere the world be past."

Goldsmith had a most happy gift of satire. He could hit off the character of his acquaintance with a touch that was keen, incisive, but never ungentle. Thus of his great friend, Edmund Burke:—

"Here lies our great Edmund, whose genius was such,
We scarcely can praise it too much;
Who, born for the universe, narrow'd his mind,
And to party gave up what was meant for mankind.
Though equal to all things, for all things unfit,
Too nice for a statesman, too proud for a wit;
For a patriot too cool, for a drudge disobedient,
And too fond of the right to pursue the expedient."

Immediately after the inauguration of the Goldsmith statue, a meeting, at which his Excellency the Earl of Carlisle was present, took place in the Provost's House, and it was decided that a statue of Edmund Burke should be erected in front of Trinity College, where the vacant pedestal has been put up by the Goldsmith Statue Committee; and that the honorary secretaries and the members of the committee (with liberty to add to their numbers) of the Goldsmith statue, be requested to carry out the project. Several subscriptions were at once promised.

A monument to the memory of the late Lord and Lady Sudeley is to be erected in a chapel, which is to be specially prepared for the purpose, at the family seat of Toddington. The monument consists of a Gothic platform between two and three feet in height, sustaining two slabs, on which rest life-size figures of the deceased. The baron is represented in his peer's robes, and the lady in a flowing dress. The base of the monument is adorned with eight sculptures, consisting of four angels at the corners, and in the centre of the sides the four Evangelists. The intervening spaces are filled with heraldic shields, tracing the genealogy of the family. The entire tomb is of white marble. Mr. Lough was the artist.

A stone obelisk, 27 feet high, with a white cross at the top, is to mark the resting-place of the late Lord Elgin, under a Himalaya noak in Dhurmsala churchyard.

SCHOOLS OF ART.

The Cambridge School.—On the occasion of the opening of this school, an address on "Art Life" was delivered to the students and their friends, in the small assembly-room, by the Rev. J. P. O. Tomkins, of St. John's College. Mr. H. H. Harris, the mayor, took the chair, and in introducing the lecturer, remarked that the school had been established for five years, and during that period had met with great success. The juvenile and artisan's classes were not so fully attended as could be wished; but this, when it became known, would, he thought, soon be remedied. The lecturer, in course of his address, said, incessant work was the only talisman to open to a man the enchanted portals of fame. Time spent in lamenting the ingratitude of the world, in wailing over hard fortune, and in fault-finding, would be lost time; and many men of great talent had been in some measure lost to the world by allowing themselves to despond, as was the case with Haydon; whilst others, feeling the existence of their talent, had worked on steadily through poverty and discouragement, till finally they took their right place in the world: of this latter class the lecturer alluded to the poet Wordsworth as a good example. Instances were given of men of acknowledged genius who had worked at their art in such a way as to prove beyond a doubt, that any man, however great his natural ability might be, if he would do great things, must work with unceasing perseverance. To succeed in art pursuits, a man must have a real love of his art for its own sake,—he must have a higher view of his calling than the mere making a living by it. If a man wanted to succeed in his art, it must be by love of it and by self-sacrificing effort. In all learning there was much wearisome bitterness to be got over, before they could fully enjoy it, and a hard apprenticeship must be served before they could become masters.

The Kidderminster School.—The annual meeting of this school has been held in the Music Hall, Kidderminster; Lord Dudley in the chair. There was a good attendance. The report congratulated the subscribers and the public on the highly satisfactory position of the school as regards the progress of the students. The total number receiving instruction in drawing in or through the agency of the school during the past year exclusive of private pupils, has been 508. The totals for the year as compared with 1862 are as follow:—1863: Pupils, 508; medals, 14; prizes, 55; honourable mention, 2; certificates, second grade, 14; certificates, first grade, 23. In 1862 it stood: Pupils, 520; medals, 10, prizes, 20; honourable mention, 0; certificates, second grade, 12; first grade, 24. A national medallion was awarded to Mr. Perks, and he received the appointment of art pupil teacher for Kidderminster. At the last examination, five works from the central school were selected for the national competition in April next. In addition to the prizes specified above, a prize studentship was awarded to Mr. Peter Morrison, one of the students of the central school. The artisans' class has been attended by twenty-one persons engaged in designing for carpets. Of these, seven had, during the present year, been selected by manufacturers, and others from amongst the junior students for employment in connexion with the staple trade of the town. Appended to the report was the balance-sheet, which showed a balance in favour of the school of 19*l*. 19s. 3d.

CHURCH-BUILDING NEWS.

Colchester.—The new chapel at Colchester Union-house was opened on New Year's-day by a dedicatory service. The chapel is of Gothic character, in harmony with the main structure; and of course dispenses with anything like ornamentation. The external walls are of grey stock bricks, with stone weatherings to the piers and white brick dressings to the windows. The roof is slated, and surmounted by a small cupola of louvre boarding, which serves as an escape to the ventilating shaft. The inside dimensions are 47 feet by 26 feet, with a height of 15 feet to the wall plates, and of 25 feet to the top of the roof, which is of semi-circular form, with exposed ribs of stained timber supported upon stone corbels, the intermediate bays being ceiled. There are three ventilators in the roof, communicating with the central shaft already mentioned; and the chapel is warmed by an ornamental radiating stove in the centre, with descending flue, communicating with an outside shaft at the west end. The fittings are of stained deal. There is a small vestry attached to the south-west angle of the building. The chapel is approached from the house by a glazed covered way, and there is another entrance by a flight of steps from the hospital yard. The design for the chapel, selected in competition with others, was furnished by Mr. S. C. Mansfield, of Colchester, who also obtained the contract for the building.

Petworth.—The new chapel in the cemetery is now finished, and the funeral service performed there. Ever since the new cemetery was made great inconvenience has been felt in consequence of there being no building in which to perform the funeral service. This having been pointed out to Lord Leconfield, he at once offered to provide the money for the erection of a suitable building. The work was entrusted to Messrs. Whitcombe, builders. The cost of the building amounted to 270*l*., the whole of which was provided by Lord Leconfield. The stained windows were presented by Mr. Henry Upton, of Meadow Lodge, Petworth.

Bedminster.—The parish church of Bedminster has just received the addition of a pair of bronze gates for the dwarf chancel-screen which separates the choir from the nave of the building. The presentation has been made by the sisters of the late Mr. H. W. Alleyne, of Clifton, and Exeter College, Oxford, as a tribute to his memory, and are from the manufactory of Messrs. Hardman & Co., of Birmingham, brass-founders. The gates are finished in chocolate-coloured bronze, relieved by brasswork in the ivy leaf and stem pattern, to harmonize with the architectural character of the church.

Cheltenham.—The subscription for the tower of St. Mark's now reaches over 400*l*., or about one-half the amount the public are invited to

contribute; a friend having offered 400*l.* when 800*l.* shall have been subscribed by others; the total cost of the structure being estimated at 1,200*l.*——The erection of a new church has been for some time past under discussion by certain members of the congregation of St. John's.

Willenhall.—It is proposed to re-build the parish church here. The entire cost of the reconstruction will be about 4,000*l.*

PROVINCIAL NEWS.

Lynn.—The *Norfolk Chronicle*, speaking of the Corn Exchange here, says:—"This building, erected by contract for the Corporation but a few years since, has been a never-failing source of annoyance to its owners and occupants. In external appearance it is about as far from handsome as need be—a thin mask of stone, in the Palmerstonian style of architecture, scarcely concealing an ugly shed of brick, iron, and glass. The interior accommodation combines almost every possible discomfort,—in summer a baking heat, which all expedients (whether in the way of canvas spread over the roof to keep out the sun, or holes cut in the walls to let out the heated air) have failed to remedy; and in winter a perishing cold, the temperature being but a few degrees above that in the open air. The floor, of exceedingly rotten flagstones, is one of the worst ever seen; and the roof deserves a similar *encomium*, as it persistently refuses to keep out wind and water. Some temporary repairs to the roof have been ordered by the committee; but when winter is over, extensive alterations or renovations must be undertaken. Mr. Sinclair, the Great Eastern Railway Company's engineer, has been consulted by the borough treasurer on the subject, and has given some simple and commonsense suggestions as to the rules to be observed in the construction of such roofs."

Bristol.—At the Clifton Suspension Bridge, several lines of links, forming the first chain, have been fixed in permanent position, while the second chain has been begun, and, being connected across the river, will now be carried on simultaneously with that of the first chain, the one running immediately over the other. The third chain, which will finish those on one side of the bridge, will be on the top of this again, and each chain will be composed of twelve lines of links. To the eye of the observer the chains appear to rest on the temporary bridge, but that is not the case. Each chain, as it is connected with the pier on either side of the chasm, supports its own weight.

Cheltenham.—A "Report on the Sources of an Additional Supply of Water to the Town of Cheltenham," by Dr. Wright, compiled at the request of the local Improvement Commissioners, has been printed for private circulation. Dr. Wright thinks it would be better, in the first place, that the town should derive its supply from its "own legitimate district;" and recommends the Dowdeswell valley and the Chelt as the two most promising sources, provided they can be touched at a reasonable cost. Charlton Abbots and Sudeley valley are then recommended as giving a good yield, with the certainty of no opposition from Mr. J. C. Dent. The Severn would also, of course, furnish a sufficient supply; but the "expenses of filtering and pumping, and the distance the water will have to be forced, present difficulties the surmounting of which will involve a large outlay." The Forest of Dean is indicated as a promising source in the event of other suggestions failing; and a spring at South Cerney, near Cirencester, belonging to Mr. W. Boodle, is alluded to at some length. This spring throws out no less than 1,500,000 gallons a day of beautifully clear water; but Dr. Wright points out the possibility of the flow being intercepted before it issues from the ground, the expense of pumping to a sufficient level to insure its flow to Cheltenham, the great distance of transit, and the claims for compensation which would probably arise, as obstacles to its adoption which must not be lost sight of.

Newport (*Monmouthshire*). — The Duke of Beaufort is about to erect a new market at Newport. From the thirteen tenders opened at the offices of the Duke's architect, Mr. T. H. Wyatt, of London, the tender of Mr. H. P. Bolt, of Newport, was accepted, at between 6,000*l.* and 7,000*l.*, for the complete erection of the market. The building will cover an area of 1,875 superficial feet, having a commanding elevation, surmounted by glass domes and roofs, containing an area of 7,716 superficial feet of glass. There will be seven arched entrances,—three from Griffin-street, three from Market-street, and one from the Crown Hotel arcade. The basement floor will contain provision for the clerk's office, 74 meat-stalls, 44 vegetable-stalls, 10 cheese-factor's shops, a weighing-room, a corn-market, 76 feet by 23 feet, and a pitch-sack dry market adjoining. A gallery will be supported by iron girders, resting on 66 iron columns. Four broad stone staircases will lead to that department, where there will be accommodation for 104 sellers of poultry, butter, eggs, &c.; 16 for boot and shoe makers; and twelve for hawkers; with a thoroughfare for the public. The front of the gallery will have an ornamental cast-iron protection. The roof will be all of iron framing, supported by 86 columns. The whole will be probably completed in about 18 months.

STAINED GLASS.

St. Paul's New Church, Southport.—All the windows in this church (which is not yet consecrated), are painted. The principal one is that at the west end. It is a memorial of a child who died twelve years ago, the son of the donor of these windows. The subject of the painting is that scene in the life of our Saviour, where he rebuked his disciples for their uncharitable conduct, and said, "Suffer the little children to come unto me, and forbid them not; for of such is the kingdom of heaven." In the centre of the picture is the figure of Christ surrounded by children and their mothers in all the attitudes of wonder, admiration, and love, while further off stand the disciples grave and meditative under the rebuke which they have received. In the background are seen the temples and houses of Jerusalem. In a separate compartment, at the bottom of the window, the scroll-work contains the inscription. On the way towards the other extremity of the edifice, it is seen that the four smaller windows on each side are painted in grisaille work. In the transept are two windows. In the compartments of that to the south, at the top are represented the three patriarchs, Abraham, Isaac, and Jacob, while the body of the window is occupied by large figures, representing Moses, Samuel, Isaiah, Jeremiah, David, Solomon, Ezekiel, and Daniel. The window at the opposite end of the transept is of circular form, and in the centre is painted an effigy of St. Paul. The surrounding compartments of the window are ornamented in mosaic work. The back of the chancel recess is principally occupied by three windows, of large dimensions, the two outer of which are occupied by representations of the four Evangelists, and under each figure is depicted the appropriate emblem. In the centre window are several small scenes portraying incidents in the life of our Saviour, as his birth, his baptism, his entrance to Jerusalem, his crucifixion, and his ascension. There are several smaller windows in the chancel, and these are stained in grisaille and mosaic work. These windows are all from the manufactory of Messrs. Lobin et Fils, of Tours, Indre et Loire, France, whence workmen have been sent over to place them in the church.

St. Lawrence, Hawkhurst.—The old church at the Moor has just received a donation in the shape of a new east window of stained glass, the gift of Colonel Loyd, of Lillesden. The window is a large one, of the Late Decorated style: it is five-lighted, and occupies the entire width of the chancel proper: the head is of flowing tracery, bearing a resemblance to a rose, the centre of which is over the middle light. Springing from this centre are, as it were, six pointed petals, and on the outer side between each two of these (except the lower two, where the centre light rises higher than the others), are other petals. The subject depicted is the story of the "Crucifixion," the main feature of which occupies the centre lights. On the left our Saviour is represented "bearing the cross," and "dissolving;" on the right his "entombment," and "Noli me tangere." On ten smaller compartments below these are figured an angel with "hammer," another with "spear," another with "bag and rope," with "thorns and pincers," with "hyssop and scourge, rod," &c.; and on the five lowest compartments are represented the "agony," the "betrayal," the "Ecce Homo," the "scourging," and the "crowning with thorns." The head of the window is also pictured, having angels singing their "Alleluias" over the events represented below. The work has been executed by Messrs. Clayton & Bell, and the window is erected in memory of the father and mother of Colonel Loyd.

THE LINSEED OIL QUESTION.

WE continue to receive letters on this subject, but, as they do not advance the position, we cannot find space for them. T. L., amongst them, says,—

"My opinion is that it is in the hands of the painting trade alone to finally settle this question, by meeting together to discuss the subject of forming a company, as soon as possible, to manufacture whitelead, linseed oil, driers, varnish, &c., of the very best quality, for cash at the company's works or on delivery. The expense of travellers might be saved, as there is scarcely a doubt but the trade throughout the country would be only too glad to send orders, feeling fully assured that the very best and genuine articles only were made."

Another,—R. P.,—calls on our correspondent, A. M., to supply information as to his process.

The following paragraph occurred in the *City Press*, Nov. 28th:—

"About the year 1512, the adulteration of oil, &c., was carried to such an extent that Government was forced to interfere, and the result was an Act of Parliament which empowered the mayor, with the consent of the master and wardens of the Company of Tallowchandlers, to examine all oils and tallow, and to punish all those who adulterated the same. But says Chamberlain, 'no reward being ascertained for the searches, it was soon neglected;' and when, in the reign of Elizabeth, they petitioned for further privileges, says Strype (1720), 'the Mayor and Aldermen of the City, and all other the chief governors thereof,' resisted the same."

The Act mentioned might be usefully renewed, but it must evidently not be left to the tender mercies of the Company of Tallowchandlers to enforce it, even if the searchers *be* rewarded.

IMPROVEMENT OF CHURCHYARDS.

AN improvement has been made in the graveyard of St. Mary Elms Church, Ipswich, which deserves notice. The improvements have been planned and the work personally superintended *con amore* by Mr. T. Shave Gowing, who resides in the parish. The *Ipswich Journal* says:—"The method in which Mr. Gowing proceeded with the graveyard itself was to divide it into a system of beds and grass plats, not by means of arbitrary forms and figures, but on such a plan as was suggested to the eye by the manner in which the graves were grouped and by the forms of the intervening spaces. Wherever a number of graves could be circumscribed by an irregular line, the line has been drawn, and all the space within that line has been turned into a bed in which shrubs and flowers are planted. Beds of this irregular kind, never angular or awkwardly shaped, but always cut in flowing, curving lines, have been formed all over the ground, and a connected intervening space without graves has everywhere been spared to lay down with grass, giving access to all parts of the churchyard, and a good approach to all the beds. A number of graves, tablets, and monuments, sometimes clustered together, and sometimes straggling, would leave the operator a choice of forms in which the beds should be made, and of this Mr. Gowing has availed himself to throw the beds and groups of graves and shrubs into such positions and relations towards each other, and towards surrounding objects, as to produce a harmonious and pleasing effect; so that, as the shrubs grow up, here an ugly bit of a neighbouring building will be hid, there a buttress or turret of the church will be brought into relief, and further on, an unseemly straight line of tablets will be broken in appearance and be made to harmonize with the general effect."

THE PICTURES DISCOVERED IN GLOUCESTER.

FROM accidental circumstances, I am enabled to clear up the mystery about the "fine portrait of Pope," and the "Temptation," by Guido, lately discovered walled up in "Pope's room" in the Guise mansion at Gloucester. My grandfather, Richard Guise, of Clewer, Berks, who died at an advanced age in the very beginning of the present century, told me that when his nearest relative, General Guise, left by will to Christ Church College, Oxford, his valuable collection of pictures (so valuable that they were sent to Manchester for the Arts Exhibition in that town, which followed *the* Exhibition in London), his heirs were grievously disappointed at the loss. These pictures, no doubt, hung at his country mansion in the county. Pope's portrait, and the "Temptation," by Guido, formed part of the

furniture in the Guise residence at Gloucester, and, we may naturally suppose, were secretly "walled up" out of sight, to prevent their transmission to Christ Church as part of the legacy to that college. Such a step would shut out any claim or dispute about them afterwards; and they could, in due time, be unwalled, and again restored to the Guise family. The parties privy to this concealment dropped off, and the hidden treasures were entirely forgotten.

It is not improbable that Pope himself presented his portrait to the family, to be hung up in the room to which they had so complimentarily given the poet's name, from his being a frequent visitor at the house, and occupying this very apartment. That he was in the habit of marking his stay at the mansions of the great by some token of his friendship and esteem may be seen by reference to his works (ed. 1770, vol. v., p. 316). A letter there records that the poet, on a visit to Sherborne Castle, Dorset, planted a clump of Scotch firs on "Jerusalem;" but why this name was given to the spot is not known. But a still more touching token of the poet's regard for the Digby family is the epitaph in the Abbey Church on the Hon. Robert Digby, who was early cut off, to the great grief of his father, 1726,—

"A man to all the country dear,"—

whom the people called, *par excellence*, the Good Lord Digby. The son of whom he was thus bereaved was the especial friend and admirer of Pope; and, according to Pope himself, as rich in learning as he was in virtue (p. 317). The epitaph, full of commendation, will be found in vol. iv., p. 54.

The record left by my grandfather on the Guise pictures at Oxford, and my own observations, as a native of Sherborne, on Pope's epitaph, will explain the late interesting discovery at Gloucester mentioned in your last week's publication.

A DESCENDANT OF THE GUISES.

"CHANCELS OR TRANSUBSTANTIATORS."

SIR,—The Rev. William Purton heads his last letter "Chancels or no Chancels;" thus, even in his title, resorting to that common trick of sophists, the raising a false issue. In the same spirit he proceeds to describe as my theory, "that the building and adorning of chancels arose entirely out of the dogma of transubstantiation." This is exactly the opposite to what I have stated; viz., that for the first nine centuries chancels were erected simply as recessed platforms for ministers; and that during the Middle Ages, in countries of new converts, where no architectural precedents existed to control the imaginations of the priestly architects, they erected screened temples, retaining the name of chancels, but resembling them in little else; and that the transubstantiation dogma was the cause of the change. So clearly is this the fact that I could undertake to map out its progress by a collection of the plans of churches from the tenth to the fourteenth centuries.

Short of pulling them down, the Church of England, at the Reformation, by stripping the Mediæval so-called chancels of their screens and altars, and ordering the table to be brought out into the nave, gave a meaning to her words, that "the chancels should be as in times past." That, no sophistry can put aside.

I certainly did accuse Mr. Purton of so quoting Eusebius as to make him speak exactly the contrary to what he wrote; and Mr. Purton now tries to excuse himself by innocently stating, "I simply remarked that Eusebius was clearly speaking of the bema." The writer thus himself defines the very perversion of which he was guilty. Eusebius begins a sentence by speaking of the seats of the ministers, without mentioning the "bema" at all, though, of course, this was implied, as I admitted; and then, in natural sequence, proceeds to describe the seating of the congregation all round, the church being implied; and follows with the statement that the table or altar was in the middle. The seats and the frame near them intervene between the table and the "bema." There is not even the shadow of a doubt about the meaning of the passage.

It will tend to clear the mind of my reverend opponent if he will bear in memory the simple fact, that *cancelli*, in plain English, means railings, and that though at one period the table in the midst of the people was surrounded by *cancelli*, he is not to gather from that fact that it was therefore on the "bema."

It is easily traceable how these light network railings, to keep off the multitude, came to be placed around the table.

The Lord's Supper was instituted at a supper table, and at the end of the repast; and the feast and the rite continued to be celebrated together for nearly three centuries.

The sensual conduct of the people at the preliminary supper led to that being discontinued and to the table itself being railed off, and to full members only being admitted within the railings during the celebration of the Communion.

In the fourth century the Council of Laodicea decreed that the clergy only should go within the railing; the prohibition being itself a proof of the previous practice and of where the table stood.

Another decree of Council in 567 took off this restriction on laical rights, and ruled that the "holy of holies" should be opened both for men and women, to pray and communicate in at the time of oblation.

The change from sitting or reclining to standing was evidently part of the punishment brought on themselves by the misconduct of the people of that day; but it was not till the twelfth century that kneeling while receiving the Sacrament was introduced.

The "Apostolical Constitutions" were forged for the purpose of glorifying the episcopal order; but barefaced forgeries as they are, valuable information can be gleaned from them of the customs prevailing at the time they were really written. Thus, from these "Constitutions," as well as from Chrysostom and other writers, we learn that the sexes were separated in some instances by *cancelli* running between them, the men occupying one side of the table and the women the other,—another clear evidence of where the table stood.

Mr. Purton states that the *onus probandi* lies with me. I tell him once more that I have again and again given this proof, in a shape no architect or antiquary can question, by pointing out that the seats of the presiding bishop and his fellow presbyters were invariably at the extreme end of the apse or recessed platform, against, and built out from, its end wall; and that, therefore, no altar could have stood on the platform between the ministers and the people so long as the old chancels were employed as they were designed to be used. The fact that modern mock chancels have been constructed in front of the old ones, boxing them out from sight as well as use, is conclusive on this point.

The case is made stronger by the fact that in the fourth century we have distinct evidence that the bishop sat while preaching. Thus it is related that Constantine stood while bishop Eusebius was delivering his sermon sitting. The Pope claims to be the successor of St. Peter as bishop of Rome: it is, then, a very significant fact that there are two churches at Rome named after that Apostle, the modern St. Peter's and the old one of the Constantine age; but this latter was never the chief church in Rome. The church of St. John Lateran always did, and still does, occupy the highest rank; and the iron force of precedent compels every Pope to creep into the old stone seat in the old chancel behind the modern one, out of sight of the people, before he goes to the modern St. Peter's to be enthroned in public. The same force of precedent compels the Italian *papa* to go to the old church of St. Peter and say mass on a little wooden table which is affirmed to be the veritable one used by the apostle.

No one of the examples referred to by the rev. gentleman helps his case, because all that he relies on in them as doing so are modern additions.

I cannot pretend to fix the precise period at which the table or stone tomb, called an "altar," was moved from its position in the nave on to the bema: the decree of council at the close of the sixth century proves that at that time the table was in the nave; and the last church referred to by Mr. Purton, that of San Clemente, which he rightly states to have been rebuilt in the ninth century, has the usual apse with its stone seats for the ministers,—a simple, primitive chancel, in fact, with a modern mock one in front of it. Here, then, is a proof that in this church, in the ninth century, the table must have been in the nave.

In writing to architects, your correspondent would do well to be more cautious as to his figures, as he nearly trebles the depth of the apse or chancel in old St. Peter's, and almost doubles that of Santa Maria Maggiore.

If Mr. Purton will seat himself in imagination in the episcopal seat against the apse wall of any one of the real old churches, and look before him at the altar in its modern position, with its pillared canopy and heavy screen in advance of that, and then reflect how the people in the nave were to see him or hear the eloquent discourse, on their rights as kings and priests, that on his to flow from his lips, he will inevitably arrive at the conclusion that the said "altar" and screen were intruders, a fact of which there is incontrovertible proof, as well as of the truth that the Communion-table invariably stood, and ought to stand, in the centre of the church, and in the midst of the people.

JOHN ELLIOTT.

THE SAFETY OF THE NATIONAL GALLERY.

SIR,—A recent notice in the obituary of the *Times* gives reason for believing that a family, apparently numerous, inhabit apartments immediately beneath the rooms of the National Gallery, which contain our priceless works of art. A family must, of course, have cooking, fires, and lights (perhaps gas). Let us hope that no destruction by fire of our national collection may occur; but surely it deserves a serious inquiry. We have seen the Custom House, the Tower of London, the Royal Exchange and the Houses of Parliament burnt down, the latter by overheating the flues. Campden House is supposed to have been burnt down by frying sausages at night. At the British Museum and at the Kensington Museum official readers are under the eyes of the directors. What necessity can there be for a domestic establishment under the very floors of the National Gallery?

IDLER IN LONDON.

CAN THE NOISE OF PAVED ROADS BE LESSENED?

I SHOULD feel much obliged if any of your readers could give information on the subject of preventing the noise arising from paved roads. Paving is, in all other respects, so far superior to macadamizing, that any assistance they can afford readers to lessen this one drawback to paving, I am sure it would be conferring a great boon upon the community.

A CORPORATION SURVEYOR.

CONGLETON TOWN HALL COMPETITION AND THE ARCHITECTURAL ALLIANCE.

WE are requested to publish the following letters which have passed between the officers of the Architectural Alliance and the town-clerk of Congleton:—

"To the Mayor and Corporation of Congleton.

GENTLEMEN,—We, the officers of the Alliance, embracing gentlemen of architectural practice, and including among its members a large proportion of the principals in the kingdom, we beg respectfully to address you in the subject of the competition for your proposed new Town Hall.

Our attention has been called to the report of a meeting of the Congleton Council, at which the town-clerk stated that he had replied to questions by intending competitors, —"No plans were given as to the employment of the successful competitor to carry out his design;" and "that it was not unfrequently the case that the designs of one architect were carried out by another." And also by individual members of the corporation, "that in works involving an outlay of 5,000*l*., it was usual for architects to charge less than five per cent. commission."

Being assured that you wish to adopt the usual course, and would desire that the intending competitors should have confidence that you will adopt that course, we take the liberty of pointing out what is the usual practice of our profession, and, at the same time, the most advantageous for the employer.

Although cases of doubtful character occur in which the design of one architect has been carried into execution by another, they are quite *exceptions* to the general rule; and, both on account of the injustice to the designer, and the unsatisfactory nature of the arrangement to *all* parties concerned, should not be quoted as precedents.

It should be remembered that the premium you offer (25*l*.) is not at all adequate remuneration, *in itself*, for the talent and labour involved in preparing a design for works involving an outlay of 5,000*l*.; if even that sum were assured to every competitor; how much less so when each competitor has only the chance of that sum? It is quite clear that no architect of any position or practice at all would compete for the mere chance of the *premium*. Those who do compete will do so in the hope that the usual course will be adopted, and the successful competitor be commissioned to carry out his design at the usual rate of remuneration. It is also clearly to the advantage of the employer that his proposed building should be carried out by the designer. No one else can fully understand his intentions, as indicated in a few general drawings, but the designer himself; and it is impossible that another architect can take the same interest and trouble in working out the design, especially when he knows that any faults discovered when the work is completed can be laid on the designer, and not on his shoulders.

With respect to the commission, we beg to assure you that the usual and proper commission for such works as you propose is never less than five per cent on the total outlay, and all, nigh the sum is of course considerably more than if the outlay were only 1,000*l*., still, when you take into account the immensely-increased amount of thought, artistic skill, and responsibility, involved in a work of 5,000*l*. than in one of 1,000*l*.—to say nothing of the immense increase in the number of drawings, and the amount of superintendence required, it will be found that five per cent. commission is as well earned on a work of 5,000*l*. as on one of 1,000*l*.

The clerk of the works' salary is never included in the architect's commission. Assuming the works to be completed in eighteen months, the wages of a clerk of works worth anything would consume more than half the archi-

tect's commission. And although it is very important that the clerk of works should be *nominated* by the architect, he is always appointed and paid by the employer.

Although you may find persons who will undertake works for less than the proper professional commission, as a rule they make it up in modes which no respectable architect would condescend to; and you will find in the end that it is much cheaper to employ a competent and respectable architect at the proper remuneration; especially on such works as you propose, in which he should be able to give proper embodiment to the public spirit in which you have originated the scheme.

Hoping that you will adopt and make public the adoption of our suggestions, and assuring you that our only wish is to preserve the honour of our profession and the character of our public work,

We have the honour to be, &c.,
T. ROGER SMITH, President.
J. H. CHAMBERLAIN, Vice-President.
J. P. PRITCHETT, Treasurer and Hon. Sec."

"Borough of Congleton, January 8th, 1864.

SIR,—I beg to acknowledge the receipt of a communication which has been directed to me on behalf of the mayor and corporation of this borough by you, as president, and by Mr. Chamberlain and Mr. Pritchett, the vice-president and hon. secretary of the Architectural Alliance, on the subject of the competition for the proposed new town hall for this borough.

I am much obliged to you for that communication, as it enables me to remove an erroneous impression which appears to exist with reference to my own views on the subject commented upon in your communication, and to the intentions of the corporation with reference to the competition.

I am not aware what newspaper it is which contains the report to which your attention has been called, and in which report I am represented as having said that I had replied to questions from intending competitors that 'no pledge was given as to the employment of the successful competitor to carry out his designs,' and 'that it was not unfrequently the case that the designs of one architect were carried out by another.' I cannot imagine how the first quotation can have been attributed to me, for the very contrary of the quotation is what I actually said. The case is simply thus:—the whole arrangements for this competition were left in the hands of a special committee by the council. The committee, through me, issued plans and particulars to every applicant. Several gentlemen who had so applied for and received the plans, wrote to me, asking if the architect whose plans should be selected would be employed to carry out the work. To every one of these gentlemen I at once replied, unhesitatingly, in the affirmative, and I then believed that to this rule (supposing the architect to be a competent man) there was no exception. The committee, having so far carried out their work, a special meeting of the council was called, to confirm what had been done so far.

To that special meeting I, as town clerk, explained the several acts of the committee, in order that they might be formally confirmed; and in that explanation I distinctly stated that, in answer to inquiries made on the subject, I had replied that the successful architect would be employed; and that I believed the question had been asked because I had since learned there were cases in which the architect simply received the premium offered, the plans were retained, and the work entrusted to another; but that our committee had expressly refused to reserve to themselves that power, and had authorized me to state to all applicants that the successful man would certainly be employed.

That resolution of the committee was, amongst others, unanimously confirmed by the council; and this part of the question, on which there was not and never had been, either in the committee or in the council, or with myself, a second opinion, fully and decisively disposed of,—as the report to which your attention was called ought to have shewn. As I have said before, I did not even know there was an exception to the rule, until I saw an advertisement in the *Builder* which appeared to imply the contrary.

The report is correct so far as the conversation, with reference to the commission, which took place in the council is reported, but what was said was the opinion only of one or two members (of one only, I believe). I shall lay your communication before the council at their next meeting, and there is not the least doubt that, when the proper time arrives for making the necessary arrangements with the successful architect, there will be no deviation from the ordinary rule. You are of course aware that the council have at present in no way entertained the subject of the commission. The conversation, as reported, did not last many minutes, for the subject was not one of those which the corporation had specially met to discuss, and no importance should be attached to what fell from individual members of the council on that occasion.—I have the honour to be, &c.

CHRIS. MOORHOUSE, Town Clerk."

THE STAGE.

Drury Lane.—We very willingly mention that the attention of Messrs. Falconer & Chatterton having been directed to the case of extortion by one of their box-keepers, set forth in our last, they inquired into the circumstances, caused the delinquent to refund the money to the person from whom it was taken, and we believe punished him. The new piece, "Night and Morning," by Mr. Falconer, is not equal to some of his other productions, including no single character for whom the audience care one jot. It will nevertheless serve to run on with the pantomime, which fills the house nightly.

The Princess's.—"Donna Diana," founded by Mr. Westland Marston on the plot of a well-known Spanish comedy, is an elegant and refined production, calculated to maintain his reputation as a dramatic poet. It is acted by Mrs. Charles Young, Mr. Vezin, and Mr. George Vining, the lessee, with remarkable discrimination, ability, and completeness, and must afford genuine pleasure to all who can find it in the able portrayal of character. The title of the Spanish play, "Disdain against Disdain," gives the motive of the plot.

PAYMENT OF ARCHITECTS.

CONGLETON TOWN HALL.

I SEE from your periodical that the promoters of the Congleton Town Hall talk of requiring that the architect employed to erect the building should receive *less* than the usual five per cent. commission. Now, from my experience in this city (Manchester), I have no doubt but that some self-styled architects have made the proposition to the council. It is not uncommon to be asked one's terms, whether five or two and a-half per cent. It is, therefore, time for the profession to better itself, five per cent. being barely remunerative.

The evil has partly arisen from architects taking pupils without, or with very little, premium; also from parties practising who have been builders, bricklayers, masons, and carpenters, supposed by the public to be "practical men," but who are, nevertheless, utterly ignorant at least of the theoretical part of the profession; and who, in cases of emergency, employ a draughtsman to design for them. If they possessed real talent, I should not object to their success. The consequence is, instead of the professors of architecture holding up their heads as equal to those of any of the other professions, they are fast losing *status*.

QUOCUNQUE.

RAILWAY COMPENSATIONS, GUILDHALL.

THE Court was occupied the whole day on Saturday in disposing of a number of claims for compensation upon the Metropolitan Railway Company, in respect of property required for the extension of that line to Finsbury; but the only case calling for particular notice was one in which Mr. Glancy, the occupier of a public-house, known as the Jacob's Well, in Barbican, claimed the amount of 1,232*l.* as compensation for the compulsory removal and sacrifice of his trade profits and goodwill.

Mr. Prentice, instructed by Messrs. Stuchbury & Davis, appeared on behalf of the claimant, and urged in support of the above claim that the trade annual takings were about 1,470*l.*, which, with the additional sum of 84*l.* received for a portion of the premises let off, made the gross income 1,550*l.* The gross expenses of conducting the business, including the stock purchased during the year, amounted to about 1,150*l.*, leaving a net profit to the claimant of 400*l.* per annum. The goodwill was estimated at the value of 560*l.*; the furniture, which it was customary in the trade for the incoming tenant to take at a valuation, was set down at 270*l.*; the loss on the removal of stock, 100*l.*; for loss of business, 280*l.*; compensation to builder for breaking a contract to enlarge the music-hall, 20*l.*; and some smaller items, which made up the amount claimed.

Mr. Burchell, on behalf of the company, submitted that the claim was excessive, inasmuch as the claimant was asking a large sum for his interest in property which his agreement with his landlord expressly stipulated he should not sell or receive any premium for, either directly or indirectly. The company were not in immediate want of the premises, and were, therefore, in a position to purchase the lessor's interest, which would give them the right to serve the claimant with the proper notice to quit without their being called on for a single fraction for compensation. He was willing to allow 20*l.* for the loss on the removal of stock, 20*l.* for compensation to the builder, 13*l.* for unexpired licences, 60*l.* for loss of removal of furniture—being one-third of the value estimated on the principle of three removals being equal to a fire; 40*l.* for loss on fixtures, and 100*l.* for one quarter's trade profits; making a total of 253*l.*; but, if the magistrate thought fit to give a little more, he would not oppose it, as the company's only object was to pay what was right, and if, after the production of the agreement, they paid the claimant for the goodwill, they would have to pay it over again in dealing with the City of London Brewery Company, who were the owners of the property in question.

Alderman Waterlow said nearly all the amounts had been settled, and the only point for him to consider was the question of goodwill. It had been argued that although under the agreement produced the claimant could not sell his property, it was equally valuable to him to retain; but no evidence has been adduced to show that he could have retained it, or that the City of London Brewery had the power to have allowed him to do so. He could not, therefore, assume that the tenant, under all the circumstances, was entitled to the goodwill which the Brewery Company appeared to have reserved, otherwise the Railway Company might be called upon to pay both parties for the same thing. His award was that the company should pay to the claimant the amount of 350*l.* as compensation, and no costs.

Books Received.

Tables for Earthwork. London: Vacher & Sons.

WE notice another issue (a third edition) of Mr. G. P. Bidder's Tables for calculating the contents of excavations, area of slopes, &c. We cannot wonder at the success of this simple sheet of practical tables. They come with a double recommendation,—bearing the name of a gentleman who is at once a successful civil engineer and, at the same time, one of the most remarkable arithmetical geniuses of the age. The former assistant of the Stephensons could scarcely fail to know the requirements of the users of such tables; and the arithmetical skill of the erst "calculating boy" is a guarantee against the arithmetical blunders that too often render tables of this kind absolutely dangerous to be dealt with.

VARIORUM.

"Wedgwood: an Address. By the Right Hon. W. E. Gladstone. London: Murray." This is a reprint of the Chancellor of the Exchequer's interesting address, delivered at the laying of the foundation-stone of the Wedgwood Institute at Burslem. Wedgwood and Wedgwood-ware are the subjects treated of, as our report at the time showed at some length, but not to the extent which the address merited: we are glad, therefore, to find it reprinted, as the subject is one in which the Chancellor of the Exchequer is well versed, notwithstanding his modest disclaimer in the address itself.——"Knowledge for the Time. By John Timbs, F.S.A., author of 'Curiosities of London, &c.' London: Lockwood & Co." Mr. Timbs has here supplemented his very useful volume of "Things not Generally Known," by another, embracing a wide range of subjects, historical, political, social, legal, scientific, and mechanical, compiled with his usual knowledge and industry, and forming a very interesting cyclopædia of miscellaneous information. The author has throughout availed himself of the most reliable views of leading writers on events of the day, in the form of abstracts, abridgments, and summaries, all brief, and considerably over 300 in number; and the volume forms an excellent compendium of concise notions on subjects of living interest, useful curiosity, and amusing research.——"The Patent Question. By R. A. Macfie. London: Johnson, Fleet-street." This pamphlet contains a paper submitted to the Congress of the Social Science Association, at Edinburgh, in October last; together with translations of contributions to patent reform, by M. Chevalier and other continental writers. It professes to give "a solution of difficulties, by abolishing or shortening the inventor's monopoly, and instituting national recompenses."——"Homes without Hands. By the Rev. J. G. Wood, M.A., F.L.S. London: Longman & Co. Part I." This promises to be an interesting treatise on burrowing animals. The present number contains some curious information as to the prairie-dog towns of America, and as to the fox, the mole, and such-like animals.——"The Midland Counties Almanac and Rural Handbook. 1864. Simpkin, Marshall, & Co., London." This almanac contains a great deal of miscellaneous and useful information on rural and other matters, besides the essentials of an almanac.

Miscellanea.

OPENING OF THE CHARING-CROSS RAILWAY.—The Charing-cross branch of the South-Eastern Railway is now open for public traffic. The first train started at ten minutes past seven o'clock on Monday, being well filled, and there were trains as far as Greenwich, at short intervals during the day.

OBITUARY.—We mention with very great regret the death of Mr. Joseph Woods, architect, which took place on Saturday last, the 9th instant, at Southover, Lewes. Some interesting information concerning this venerable gentleman was given in our pages not very long ago.——Last week died Mr. Charles M'Intosh, well known, particularly in Scotland, as a garden architect.——Mr. Behnes, the sculptor, died on Sunday last, after a fit on the previous day. With many foibles, he was a man of great ability.

THE ROMSEY LABOURERS' ENCOURAGEMENT ASSOCIATION.—The annual meeting of this association has been held. The Right Hon. W. Cowper, M.P., presided, in the unavoidable absence of Lord Palmerston. The dinner given to the successful candidates took place in the Town-hall, after which the prizes were distributed by Mr. Cowper, who pointed out the advantages of cultivating habits of industry, honesty, and sobriety. He strongly recommended them to attend a little more to the simple rules of health, observing, that there were many cottagers who had not yet discovered that the air which they breathed over and over again became as foul and as dirty as the water in which they washed their hands. Many people were not aware that air became as dirty as water, just because they could not see the dirt in the air; but it was quite true that air which had been breathed over and over again was just as unwholesome as dirty water could be to drink. Many were so afraid of admitting the cold air, that they excluded the fresh air. They continued breathing the same air over and over again, thus sowing the seeds of disease which too frequently terminated fatally. A large party of the subscribers afterwards dined together at the White Horse Hotel, Mr. Cowper in the chair.

PROVIDENT INSTITUTION OF BUILDERS' FOREMEN AND CLERKS OF WORKS.—At a recent meeting of this institution the librarian announced, that in addition to the books presented to the Library by Professor Donaldson, he had received a volume from the Institute of Architects. We mention this that it may lead to other similar donations.

TELEGRAPHIC PROGRESS. — There is now in Liverpool, and in operation at the Electric Telegraph Company's Offices in Castle-street, says the *Railway News*, an instrument which, from its ingenuity of construction and perfection of results, deserves most careful attention. The object is to transmit autograph messages in the exact form in which they are written; and the most complicated figures, designs, sketches, or indeed anything that can be drawn by an ordinary pen, is transmitted as readily as the simplest dot or stroke.——It is said that in three years it will be possible to send a telegraphic despatch to Pekin from London and back again in a day. This will be by means of the telegraph now erecting in Eastern Siberia.

DINNER-TABLE DECORATION.—All endeavours to improve this have our good will. Mr. Kelk, by means of a prize of 10*l.*, through the council of the Horticultural Society, directs the attention of cultivators to growing plants fitted for the decoration of the dinner-table. Many persons prefer a handsome well-grown plant, naturally covered with flowers, for the decoration of their dinner-table, to a bouquet, however skilfully arranged, or even to such decorations as Sir C. W. Dilke's prizes produced. But the great difficulty has always been to get plants in a small enough pot to admit of being put on the dinner-table. Mr. Kelk offers 5*l.* for three azalcas, and 5*l.* for three roses so adapted; that is, grown in 6-inch pots. Care should be taken that flowers for such a purpose do not screen the guests on one side from those on the other. They must be short enough to be looked over, or sufficiently high above a thin stem to give a view under.

THE NEW WORKHOUSE AT HIGHER TRANMERE. Last week the new Birkenhead Union Workhouse, at Higher Tranmere, was opened. The house, with the garden, occupies an area of nearly twelve acres. The architecture is after the Tudor style. The structure has been built of common brick, but the quoins and angles have been executed in red sandstone. In the centre of the building is a tower, in the upper part of which is a tank: by means of pipes, water can be conveyed to all the corridors of the building. At the back part of the building is a large and commodious dining-hall, capable of seating 400 persons, and which is to be used both as a dining-room and a chapel. It is said the building has cost nearly 13,000*l.*, and that it is capable of accommodating about 400 persons. The architect was Mr. Thomas Layland: the contractors were Messrs. Neil & Co., of Bradford: the work has been under the direction of Mr. Thomas Storey, civil engineer.

FIRE AT THE LONDON BRIDGE STATION.—On Sunday morning, shortly after five o'clock, a fire was discovered in the Crystal Palace department of the London and Brighton Railway station at London Bridge. The flames extended with unusual rapidity to the electric telegraph department, including the lobby, and also to another portion of the station, and to four goods trucks standing on a siding. One or two powerful fire-engines are always kept at the station, in charge of a well-disciplined fireman, but after the ordinary traffic is over this person leaves; and those left in charge, moreover, appear not to have known where the fire-plugs—of which there were several in the station — were situate. Several engines of the London brigade were soon in attendance, when another obstacle presented itself, for it had been forgotten to send for the turncock. The fire, being unrestrained, continued to spread, and seizing upon the book and newspaper depôts belonging to Messrs. W. H. Smith & Son, the whole presented a regular blaze. When water was at length obtained, the firemen succeeded in cutting off the further spread of the fire, but they were unable to get it extinguished until about 60 or 65 feet of the roof of the Crystal Palace department were destroyed, and another part, 60 feet by 40 feet, was much damaged by the action of the fire. The telegraph lobby was burned out, the offices adjoining severely damaged by fire, and four trucks were partially burned, besides the book depôt and the offices of Messrs. Smith, already alluded to, which are also burned down.

DESTRUCTION OF FIRE-DAMP. — Mr. Arthur Wall, of Birmingham, is said to have matured a means of destroying fire-damp by the use of a screen, in each heading of a colliery, containing a material which destroys the dangerous gas; the result being that the most fiery mines can be worked with absolute safety. The merits of the discovery he says can be definitely tested in a mine for less than 100*l.*; and Mr. Wall asserts that the material absorbs and decomposes the carburetted hydrogen without becoming decomposed itself—the screen simply becoming clogged with carbon, which is easily washed out with water.

THE HOTEL MOVEMENT.—An association composed of some of the leading authorities of Amsterdam, Rotterdam, Antwerp, and Brussels, in connection with an English board of equal status in the metropolis, has been lately formed, under the name of "The Grand International Alliance Hotels Company (Limited)," with a view of establishing a thorough system of communication between the hotels of the three countries, so as to relieve travellers of one half of the annoyance they experience in the course of their travels in that part of Europe.

A MAGNETIC ETHER.—In a paper read at the last meeting of the Royal Society, the Astronomer Royal propounds a theory to account for magnetic storms. The phenomena, in Mr. Airy's opinion, represent the movements of a magnetic ether which he supposes to overspread the whole surface of the earth as an impalpable fluid envelope several feet in thickness. If we then conceive this magnetic ether "to be subject to occasional currents produced by some action or cessation of action of the sun, which currents are liable to interruptions or perversions of the same kind as those in air and water," we have a theory by which the disturbances that occur in the observed phenomena of terrestrial magnetism may be explained.

PROPOSED NEW BRIDGE FROM WANDSWORTH TO FULHAM. — It is intended to remove the old bridge, which has been so long an inconvenience to the navigation, and to build a substantial one for carriages and passengers, with approaches and piers commencing at Wandsworth in the York-road, and terminating near the Peterborough Arms in King's-road, Fulham, with an approach road from the latter point, terminating in Moore Park-road, near to where it is crossed by the Britannia-road. The road on the Wandsworth side will commence in York-road and terminate at the junction of the high road from Wandsworth with the high road from there to the new Wandsworth station of the Crystal Palace and West-end Junction Railway. The estimated cost is 40,000*l.*

GREAT DISCOVERIES OF COAL IN BRAZIL.—At the last monthly meeting of the Manchester Geological Society, an announcement was made by Mr. John Plant, of the Salford Museum, respecting the discovery of three extensive coal-fields in Brazil. Mr. Plant said that his brother, Mr. Nathaniel Plant, was the state geologist in Brazil, and he had lately forwarded a description of one of three coal-fields, which were the first that had been discovered in Brazil. Mr. N. Plant, in 1862, fitted out an expedition to the districts of Rio Grande do Sul, and there discovered a large coalfield, which had been named the Candiota, extending over about 150 square miles. The second was on the Rio Ratos, extending over about 50 square miles; and the third was in the province of San Catharina, extending over about 80 square miles.

DESTRUCTION OF WHITTLEBURY LODGE, TOWCESTER.—The mansion of the Earl of Southampton at Whittlebury, has been burned to the ground, nothing remaining but the blackened walls and the stabling, which latter escaped undamaged. The house was lately thoroughly repaired and renovated, and amongst other alterations the gas-fittings and hot-water apparatus had been renewed and extended; and there seems every reason to believe that the calamity is due to the over-heating of some of the flues connected with the latter. It was with difficulty Lord and Lady Southampton, with the family, visitors, and servants, made their escape. The whole of the valuable pictures, plate, jewellery, books, and furniture were destroyed, with the exception of a comparatively few articles, chiefly from the drawing-room, which were saved. The amount of the loss whether it falls upon Lord Southampton or on insurance companies, must be enormous, from the completeness of the devastation.

TIN.—An advance in the price of tin has at last taken place, and the share-market is, in consequence, characterized by vastly increased activity. Up to Friday last the standard for ores must be quoted as follows: — Common, 107*s.*; superior common, 108*s.*; fine 109*s.*; superior fine, 111*s.* As may be supposed, the price of tin (metal) has also correspondingly advanced, as follows:—Common, from 112*s.* to 116*s.* per cwt.; refined ditto, from 117*s.* to 121*s.*

FATAL ACCIDENT WITH SHEARS AT WOOLWICH DOCKYARD. — The paddle steam-vessel Spiteful having been condemned, arrangements had been made for the removal of her boilers and machinery by means of the powerful crane and shears on the wharf, worked by hydraulic pressure. One of the boilers, having been attached to the gear, was lifted from its position, and had just cleared the hold of the ship, when the tenth link from the cylinder of the chain attached to the shears snapped asunder, and the shears suddenly canted round with the gear attached, sweeping with tremendous force over the deck, and killing three workmen, and severely injuring several others. The shears were erected about three years since, and the link of the chain which snapped is about two inches in diameter, weighing several pounds, and of wrought iron.

THE ACROPOLIS AT THE CRYSTAL PALACE.—A model of the whole of the mass of rock which dominates Athens, with its architectural remains, has just been forwarded to this country for exhibition at the Crystal Palace. The model is the work of a lady, Mrs. Avramioti, who has laboured at its completion, even to the most minute detail, for upwards of three years. It has been built to a scale of one thousandth, and in every trifling irregularity of the pile of rock, from the curious angular mass at the back of the Parthenon which in profile bears such a fanciful resemblance to the head of Socrates, down to the weather-worn stairs of the slope facing the Pirœus, this miniature *fac-simile* is said to be perfect. The footways and tracts over the marble steps which lead up from the modern capital to the remains of the ancient Propylæa are delineated. The arrangement, or rather disarrangement, of the masses of marble and *débris* of temples which litter the ground around the Parthenon are reproduced, and all the remains of the monuments are copied.

THE SCOTTISH NATIONAL MEMORIAL OF PRINCE ALBERT.— Among other designs which have been, or are about to be submitted to the committee for this memorial is one by Mr. John Steell, R.S.A., Her Majesty's sculptor for Scotland, who has not hitherto taken any action whatever in regard to this matter. The *Scotsman* thus describes the design, which, if we recollect aright, was some time since submitted to Her Majesty's inspection. The proposed memorial takes the shape of an equestrian statue, on an ornamental and elevated pedestal, the height of the whole from the base to the head of the figure being supposed to be about thirty feet. The prince is represented on horseback. The action of the animal is quiet, but without stiffness, and its head is lowered so as to show the full height of the rider. The prince's right hand and arm are raised in an attitude of peaceful greeting. From the ground the pedestal rises by several successive stages, and the lowest of these shows at each angle—which projects so as to afford the requisite space—a group of representative figures. These figures all look inward and upward to the central group; their action being that of admiration or homage, signified by their hands bearing and offering wreaths. These groups are designed to represent all classes, from the peer to the peasant. Above them the pedestal rises by two further stages, the faces of which it is proposed to inscribe with quotations from the public speeches of the prince. On the ledge of the second or upper of these steps or stages, masses of classic emblems indicative of the tastes and pursuits of his royal highness, will carry the eye up to a series of bas-reliefs panelled in the pedestal proper, which is of a more ornate architectural character than the lower part of the design. In these bas-reliefs the prince is represented as opening the Great Exhibition, in the midst of his family, &c. The design admits of considerable variety of work, embracing, as it does, distinct architectural as well as sculptural features, and would afford important independent commissions to several artists. Mr. Steell is engaged on a second design of a more conventional character. The design, however, is to be obtained by competition.

TO REMOVE OIL-STAINS FROM BOOKS.—If the stains are extensive, roll up each leaf and insert it into a wide-mouthed bottle half full of sulphuric ether, and shake it gently up and down for a minute. On its removal the stains will be found to have disappeared. The ether rapidly evaporates from the paper, and a single washing in cold water is all that is afterwards required.—*Notes and Queries.*

IMPRESSIONS OF SCULPTURED STONES.—At a recent meeting of the Newcastle Society of Antiquaries, Dr. Bruce submitted and explained a plan for taking impressions of sculptured stones. The *modus operandi*, the rev. doctor explained, is by placing upon the stone a thin sheet of gutta-percha, upon which is placed a blanket, wrung out of warm water, and pressed upon the gutta-percha, which very soon takes the impression of the stone, and in the most perfect manner, even to the tool-marks.

VENTILATION OF SHIPS IN THE NAVY.—An important part of Dr. Edmonds's ventilating apparatus has been fitted to the *Royal Sovereign* cupola-ship, at Portsmouth, in which, by a simple arrangement, from 300 to 350 natural channels actually existing in every large ship have been made available for the ventilation of the ship's bilges and the timber spaces. This is done by connecting these latter into a long air-shaft on each side of the ship, through which a draught is created by communicating it by a cross shaft into the funnel. The efficacy of this plan has been already tested in the *Royal Sovereign*, a very slight increase of temperature in the funnel sufficing to draw a current of air through the air-shafts, and necessarily through the whole frame-work of the ship, from the bilges, and which current, passing into the funnel, is carried high into the open air. This mode of ventilation promises to prevent dry-rot, by the free circulation of air which it creates over the interior timber surfaces.

TENDERS.

For a villa residence, for Mr. J. H. Mason, Donnington-road, Newbury. Mr. J. H. Money, architect :—

JOHN EDGINGTON & CO.'S WATER-PROOF TEMPORARY ROOMS, comfortably warmed, floored lighted, and elegantly decorated. Easily erected and removed. Conveyed any distance. Observe the address, JOHN EDGINGTON & CO. 48, Long lane, Smithfield, E.C. and 18, Piccadilly, W. Manufactory, 105, Old Kent-road, S.E.

TO BRICKMAKERS. -All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr ROBERT WHITE, and which may be seen in operation at the Brickfields of

J. B. WHITE & BROTHERS, Erith, Kent.

The advantages of this plan are two fold.

1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which itself represents a large permanent saving.

2nd The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.

Licenses for use of the Patent granted to Brickmakers, on application to the Patentees, 17, Millbank street, Westminster.

VICTORIA BRICK and LIME WHARF and DRAW-DOCK, NINE ELMS, S.

Mr. ROBERT LINDLEY, Mansfield Quarries, Nottinghamshire.

HY. GEORGE & COMPANY, CAEN and AUBIGNY QUARRYMEN and GENERAL STONE MERCHANTS, CAEN WHARF, ROTHERHITHE, S.E.

Seasoned Caen Stone always in Stock, and a large assortment of Sawn Slab in Parksprings, Harehill, &c. &c.

Grindstones, Steps, Sills, Coping, Landings, Paving, and all descriptions of Yorkshire Stock. Cargoes Shipped direct from the Quarries.

Prices and specimens forwarded on application.

TISBURY STONE. The WARDOUR (CHILMARE) and TISBURY STONE COMPANY, Limited,

Are prepared to execute orders to any extent for their TISBURY STONE.—This is a close, fine-grained Stone, of a beautiful colour, possessing all the qualities of the best Portland, in which range it is placed geologically.

It will supply the long-wanted desideratum of the Architect, Builder, and Sculptor, as the Stone is a first-class Weather Stone, easily worked, and carries a fine arris; and is eminently adapted for carved mouldings, high class architecture, and works of art, requiring only to be known to become the STONE OF THE DAY.

Specimens, Price, &c. may be obtained of SAMUEL TRICKETT, General Stone Merchant, Millwall; or at the Offices of the Company, 3, Adelaide-place, London Bridge.

WILLINGTON STONE WHARF, REGENT'S PARK BASIN, N.W. HY. GEORGE & CO.

MARBLE and STONE MERCHANTS. Marble, in blocks and sawn slabs; Yorkshire stone of every kind in ditto; paving, landings, steps, sills, sinks, &c.; Bath, Caen, Portland, Aubigny, and Granite. Carrocs direct from the quarries. Wrought work executed at moderate prices. Agent, JOSEPH CHADWICK.

SLATES.—JONES & CO. have a STOCK of SLATES of different sorts, from the best quarries in Wales. SLABS and CISTERNS delivered at any station in quantities of not less than five tons, from their depôts, Bangor, Garston, Saltney, Chester, and Gloucester.

Prices forwarded and estimates given on application.

1, BOLD TERRACE, CHESTER.

ROOFING SLATES, of various sizes, from 26 inches by 15 inches to 13 inches by 10 inches.

At W. SQUIRE & CO.'S, Slate Merchants and Slaters, OAK WHARF, 281, CITY ROAD, E.C.

O. M'CARTHY, CARMAN, and SAND and CEMENT MERCHANT, Whitefriars Wharf, Whitefriars, Fleet-street, City. Sand from above or below Bridge, delivered by the yard or per barge. Ballast, screened or unscreened, by the yard or per barge. Stocks, Lime, and Old Bricks. Dry Rubbish delivered, per barge, in any quantity alongside the Thames.

DESACHY'S FIBROUS PLASTER.

GEORGE JACKSON & SONS,
HAVING BECOME THE PROPRIETORS OF THE PATENT RIGHTS IN
DESACHY'S FIBROUS PLASTER,

Beg to call the attention of Architects to its Capabilities.

It is adapted for the speedy and economical production of any coffered or circular work, waggon-headed ceilings (all bracketing being avoided, as it is fixed to the joists direct), fluted and plain columns, panelled dados, all kinds of disper, &c.; for the linings of walls and ceilings, and for all purposes of ornamental plaster.

The advantages are great. It is of great lightness and of excellent quality; it is not inflammable, and is ready to be painted immediately after it is made; it has been used (under the direction of Owen Jones, esq.) for the ceiling of St. James's Hall; at Messrs. Osler's, Oxford street; Mr. Hancock's, New Bond-street; the Crystal Palace Bazaar; the Home for the Aged, South Lambeth; and at various other Works.

SPECIMENS CAN BE SEEN AT 49, RATHBONE PLACE.
DESIGNS MADE FOR ANY WORKS.
LITHOGRAPHED DESIGNS OF CEILING FLOWERS, &c. SENT FREE ON APPLICATION.

LONDON POTTERY, HIGH-STREET, LAMBETH, LONDON.

STRAIGHT TUBES, with SOCKET JOINTS, in Two-feet Lengths.

PAN, 4s. 6d.

TRAP, 2s.

HALF-SOCKET PIPES same prices as the Whole Sockets, by the use of which Drains may be readily examined, and Junctions inserted, in the event of requiring further connections.

Manufacturers also of

LOVEGROVE'S PATENT DOUBLE AND TRIPLE JUNCTIONS AND INSPECTION SHAFTS for small Sewers and Drains, by the use of which the sewers and Drains may be examined and cleansed without disturbing the surface of the ground; adapted also for ventilation of Sewers and Drains.

DRAWINGS, WITH PRICES, WILL BE FORWARDED FREE, ON APPLICATION.

ENCOURAGE COUNTRY MANUFACTURE.

WORTLEY, JOSEPH CLIFF & SON, NEAR LEEDS

ESTABLISHED 1795.

MANUFACTURERS OF SALT-GLAZED STONEWARE SOCKETED PIPES, TERRA-COTTA CHIMNEY TOPS, CLAY RETORTS AND FIRE-CLAY GOODS OF ALL DESCRIPTIONS.

MARCUS BOURNE NEWTON, LONDON AGENT.

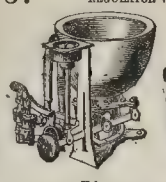
DEPOT, No. 4, GREAT NORTHERN GOODS STATION, KING'S CROSS, N.

CHEAP, LIGHT, AND DURABLE ROOFING.

CROGGON'S PATENT ASPHALTE ROOFING FELT has been extensively used and pronounced efficient, and particularly applicable for warm climates.

1st. It is a non-conductor.—2nd. It is portable, being packed in rolls, and not liable to damage in carriage.—3rd. It effects a saving of half the timber usually required.—4th. It can be easily applied by any unpractised person.—5th. From its lightness, weighing only about 42 lbs. to the square of 100 feet, the cost of carriage is small.—6th. Under slate, metal, or tiles, it is a most effective non-conductor.

INODOROUS FELT, for damp walls and for damp floors, under carpets and floor cloths. Price ONE PENNY per Square Foot.



CROGGON and CO.'S PATENT FELTED SHEATHING, for Covering Ships' Bottoms, &c. and

DRY HAIR FELT, for Covering Steam Boilers, Pipes, &c. preventing the radiation of Heat, saving 25 per cent. of Fuel, and deadening Sound.

Samples, testimonials, and full instructions, on application to

CROGGON and CO. 2, DOWGATE-HILL, London; and 2, GOREE PIAZZA, Liverpool.

J. TYLOR & SONS' PATENT REGULATOR WATER-CLOSETS.

Valve.

Pan.

The Regulator Valve gives perfect control over the supply of water to each closet, so that, however small the fall of water, perfect flushing is insured. Any number can be worked by one supply pipe. No intern-valves, cranks, or wires required. The Closets can be seen in action at the Manufactory, and Illustrated Catalogues had on application to the Manufacturers, J. TYLOR & SONS, Warwick-lane, Newgate street, London

TERRA COTTA and Fine STONEWARE FOTTERY, warranted to stand Frost.

JOHN M. BLASHFIELD, STAMFORD POTTERY, STAMFORD, LINCOLNSHIRE, has greatly improved and economised the manufacture of TERRA COTTA and Fine STONEWARE for ARCHITECTURAL PURPOSES. He is able to make it of various new colours, so as to Harmonize with Marble, Portland, and other Stones, and equal in hardness to Granite.

A Medal at the International Exhibition was awarded, in Class 10, Section C, Architectural Objects, for "Perfection in manufacture and beauty of form." A Medal was also awarded for "Terra Cotta."

Also Plain and Mosaic Pavements for Halls, Churches, Conservatories, &c. in all colours.

London Office, 377, Oxford-street, W.

PRIZE MEDAL TO MAW & CO. INTERNATIONAL EXHIBITION 1862.

IMPERISHABLE TESSELATED PAVEMENTS, combining a highly decorative and economical substitute for ordinary floors of their perishable coverings. MAW & CO.'S Pattern-book, designed by M. Digby Wyatt, esq. together with a special design and estimate of cost adapted to any given dimensions of hall, passage, conservatory, verandah, frieze, &c. will be sent on application to Benthall Works, Broseley, Salop.

May be seen at the Exhibition of Building Inventions, &c. now open at the Galleries of the Architectural Exhibition, 9, Conduit-street, free.

London Agents—W. B. SIMPSON & SONS, 456, West Strand, who have on view a great variety of Specimens of the Pavements.

PEAKE'S TERRO-METALLIC TILES, PIPES, &c.—Notice is hereby most respectfully given, that the LONDON DEPOT for this WARE is REMOVED to No. 21 Wharf, Macclesfield street North, City road Basin, N. Secondly, that the trade term, "TERRO METALLIC," is the exclusive right of the Proprietor; and Sedly, that the 'Reports of the Jurics," page 581, of the Great Exhibition, 1851, note the grant of a First-class Medal and rank the Manufacturers known so long as "The Tileries," Tunstall, Staffordshire, as the first of the kind in the world.

TWO PRIZE MEDALS AT THE INTERNATIONAL EXHIBITION.

MAGNUS'S ENAMELLED SLATE obtained the Medal of the Society of Arts; the Prize Medal at the Great Exhibition, 1851; Two First-class Medals at the Paris Exhibition; and Two Prize Medals at the International Exhibition of 1862.

Trashy imitations of this beautiful material are being palmed upon the public. Architects are therefore requested to see that the name of "MAGNUS" is upon each article.

Chimney pieces, Billiard-tables, Table-tops, Baths, Wall linings, &c. a New Illustrated Catalogue of which can be had at the Pimlico Slate Works, 39 and 40, Upper Belgrave-place, Pimlico, S.W.

TRUSSES, VASES, FOUNTAINS, BALUSTRADES, CHIMNEY-PIECES, MIGNIONETTE BOXES, &c.—The premises at Cannon-row being required for the Thames Embankment, the Patent Concrete Stone Company, Limited, are obliged to clear off the remaining Stock, and therefore offer the same at greatly reduced prices.

7, Cannon-row, Westminster, December 7, 1863.

A. J. B. BERESFORD HOPE, President.
GEO. GILBERT SCOTT, Treasurer.
JOSEPH CLARKE, Hon. Sec.

All requests for Casts for Colouration must be accompanied by a Post-office Order on Charing-cross for 5s.; or if case and packing required, 7s.

ARCHITECTURAL ASSOCIATION,
9, CONDUIT STREET.

A Paper will be read at the ordinary Meeting of the Association, on FRIDAY next, the 22nd inst. at EIGHT p.m. by F. C. PENROSE, Esq. M.A. F.R.I.B.A. on "Greek Architecture."

Visitors are admitted on giving their card or name at the door.

The Paper on "French Architecture," by T. HAYTER LEWIS, Esq. F.S.A. F.R.I.B.A. announced for the 5th of FEBRUARY, is postponed till the 1st APRIL.

CHARLES J. ADAMS,
J. DOUGLASS MATHEWS. } Hon. Secs.

BY ORDER of the TRUSTEES of the SOANE MUSEUM.—The MUSEUM, 13, Lincoln's-Inn-fields, will be OPEN this season on the Wednesday in each week in the months of February, March, July, and August; and on the Wednesdays, Thursdays, and Fridays in April, May, and June. Cards of admission to be obtained of the Curator, at the Museum; or from the Trustees.

BILLING'S PATENTS.—CHIMNEY TERMINALS.—THROAT VALVES.—NOTICE to ARCHITECTS.—The Proprietors of these PATENTS have given the Widow an Interest in the same, and have considerably reduced the price of the Articles, trusting that by so doing these useful Inventions may be introduced more generally in all new buildings.—For prices, apply to the Manager, Mr. TYLER, 12, Abingdon street, Westminster, who will also afford any information, he having been for many years engaged with the late Mr. BILLING, in the practical curing of Smoky Chimneys.

GEOLOGY.—KING'S COLLEGE, LONDON.—Professor TENNANT, F.G.S. assisted by the Rev. J. WILTSHIRE, M.A. will give a COURSE of LECTURES on GEOLOGY, on WEDNESDAY evenings, from EIGHT to NINE o'clock. The first Lecture, JANUARY 20th, to be continued to Easter. A more extended Course will be given on WEDNESDAY and FRIDAY mornings, from NINE to TEN o'clock, commencing JANUARY 27th, and will be continued to JUNE. R. W. JELF, D.D. Principal.

BY ORDER of the SECRETARY of STATE for INDIA in COUNCIL.

Notice is hereby given, that TWENTY-FIVE APPOINTMENTS in the UPPER CLASS of the ELECTRIC TELEGRAPH DEPARTMENT in India will, in the year 1864, be open to PUBLIC COMPETITION.

A Competitive Examination will, accordingly, be held in this office in the month of MAY next. Full printed particulars of the conditions on which candidates will be admitted to the Examination, and also respecting the nature of the Appointments to be competed for, may be obtained at this Office, on application, either personally or by letter, addressed to the "Under Secretary of State for India," India Office, London, S.W.

November 20th, 1863.

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 72–74, Bishopsgate-street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Medal Ranges and Stoves, Register Grates, and Cooking Utensils, to meet the great public demand; and also for the consequent more extensive execution, by the manufacturers themselves, of all descriptions of hot water, bath, laundry, and steam work.

72–74, Bishopsgate-street Within, November, 1863.

COMPETITIONS.

TO ARCHITECTS.—The Directors of the Hull Exchange Company (Limited) are prepared to receive DESIGNS for the ERECTION of a PUBLIC EXCHANGE and NEWS ROOM, together with other BUILDINGS. The expenditure not to exceed 6,000l. 50l. will be awarded to the first design, and 25l. to the second, subject to certain conditions, which will be forwarded to competitors, together with a plan of the site, on application to T. W. FLINT, Esq., Bowlalley Lane, Hull, Chairman of the Company. The Designs are to be sent in, carriage paid, and addressed to the Chairman of the Company, as above, on or before the 1st day of MARCH, 1864; and it is requested that an approximate estimate of cost may accompany each plan.

BOROUGH of WIGAN, in the county of Lancaster.—To ARCHITECTS and OTHERS.—The Corporation of the said Borough of Wigan are desirous of receiving, and hereby invite Architects and others to send in DESIGNS, PLANS, SECTIONS, ELEVATIONS, SPECIFICATIONS, and ESTIMATES for the ERECTION of a BOROUGH GAOL, containing not less than fifteen cells for prisoners, a house for the chief-constable, also a house for the gaol keeper; fire engine-house for three engines, with space for the necessary apparatus; police court and sessions room, reporter's retiring room, barristers' robing-room, attorneys' room, grand jury room, petty jury room, a general purposes room (small), bath-rooms, and kitchen for the prisoners in the basement fronting Chapel-lane), and all other necessary offices for the transaction of the business of the Local Board of Health of the said district and borough of Wigan. Plans to be of a uniform scale of an eighth of an inch to the foot. The cost of the entire building shall not exceed 12,000l. The population of Wigan is about 40,000. The person who, in the opinion of the Town Council of the said borough, produces the best design, plan, section, elevation, specification, and estimate to receive 30l.; the second best to receive 40l.; and the third best, 2l. The designs, &c. for which premiums shall be awarded shall become and be the property of the Town Council of the said borough, but the Council do not bind themselves to carry out the same design, &c. or employ the architect producing them, and will be at liberty to modify the same in any way they may think proper, and in the event of his being selected for that purpose the premium to merge in the architect's commission.

Each set of designs, &c. must be distinguished by a motto and accompanied with a sealed envelope containing the name and address of the competitor, and having a similar motto to that on the design, plan, &c. which envelopes will not be opened until after the plans are decided upon. The designs, &c., and everything intended to be submitted therewith, must be enclosed in a sealed cover endorsed "Plan for Borough Gaol, &c." and addressed to C. HILTON, Town Clerk, Wigan, and be delivered on or before the 26th day of MARCH next. The Town Council will pay to the Architect selected to carry out the work a commission of five per cent. on the outlay, to include all plans, sections, specifications, drawings, estimates, elevations, and all attendances necessary to complete the same, and no charge or extras of any description will be allowed. All the plans, &c., except the premium ones will be returned to parties for, on application to me, and no further liability by the Town Council or claims to remuneration will be allowed in respect to the plans, &c. received beyond the amount of premium herein set forth. A block plan of the site, and any further information that may be required, can be had on application at my Office on payment of the sum of five shillings for each plan.

C. HILTON, Town Clerk.

Wigan, January, 1864.

TO ARCHITECTS.—VILLA and COTTAGE RESIDENCES.—The Directors of the Manchester Villa and Cottage Association, Limited, offer 50l. PREMIUM for the BEST DESIGN, and 25l. for the Second best Design, for FOUR COTTAGES and SIX DWELLING HOUSES.

First a Row of Four Cottages, not to exceed 100l. each in cost.

Secondly, a Group of Two Houses, not to exceed 200l. each in cost.

Thirdly, a Group of Two Houses, not to exceed 300l. each in cost.

Fourthly, a Group of Two Houses, not to exceed 400l. each in cost.

The plans and drawings, at a scale of 8in. to 1ft. with figured dimensions, to be sufficient to show the respective designs, and to be accompanied with a general description of the materials and finish. Plans of proposed sites for the groups may be had from the Secretary. Buildings undertaken by the Association may be built under the superintendence of any architect nominated by the person or persons who covenant to purchase them when built. Messrs. CORBETT & BARRY, the Architects and Surveyors to the Association, will not compete for the above, but will assist the Directors in adjudicating the premiums. The designs to be sent in to the Secretary, sealed and endorsed "Designs for Villa and Cottage Residences," on or before the 30th of APRIL next, marked with a motto, and with sealed envelope containing Architect's address, or signed with name instead of motto, if preferred. Designs not adjudged to receive the premium to be returned.

JOHN WORTHY WILLIAMS, Secretary.

Offices, 26, Market-street, Manchester, January 15, 1864.

WYGGESTON'S HOSPITAL, LEICESTER.—To ARCHITECTS.—The Trustees of the above Hospital are desirous of receiving DESIGNS, with general specifications and estimates, for the ERECTION of a NEW HOSPITAL, for Twenty-five Inmates, with a Chapel, a House of Residence for the Master of the Hospital, a similar House of Residence for the Chaplain Brother, a Board-room, a Muniment-room, with other convenient Offices, and a Porter's Lodge, with suitable Entrance Gates; and for the Laying out of the Ground. It is proposed to expend on the above object the sum of 15,000l. Premiums will be awarded by the Trustees for the three best designs. All designs are to be sent in under a motto, to be accompanied by a sealed letter by which the author may be identified, with his designs, but which letter will not be opened until after the selection has been made by the Trustees from the several designs. A lithographed plan of the site, with sections of the land and conditions and instructions for the guidance of intending competitors, may be had at any time after the 1st of FEBRUARY next, upon application to the undersigned, and on payment of the sum of 5s.; and all plans are to be forwarded carriage free to the said undersigned, on or before the 30th day of APRIL next.

WILLIAM H. MACAULAY, Solicitor, Leicester,
Clerk to the Trustees of the above Hospital.

January 8th, 1864.

TO ARCHITECTS. — CHESTER NEW TOWN HALL.—The Town Council of the City of Chester are prepared to receive DESIGNS for a NEW TOWN HALL, with POLICE OFFICES and LOCK-UPS, proposed to be built upon a site belonging to the Council situate in Northgate-street. Architects wishing to send in Designs may obtain a plan of the site and particulars of instructions upon application to me, the undersigned, at the Public Offices, Lower Bridge-street, at which place the Designs must be delivered, free of cost, on or before the 2nd day of MAY next. A premium of 100l. will be paid to the author of the DESIGN which the Council shall award the first place, and a premium of 50l. to the author of the Design to which they shall award the second place; both of which Designs thereupon to become the property of the Council. But should the author of either of the premiated Designs be employed to carry out the work, the premium awarded to him will be deducted from his commission, which will be 5l. per cent. on the outlay. If the Designs sent in are not, in the estimation of the Council, of sufficient merit, the premium will not be given.

JOHN WALKER, Town Clerk.

Public Offices, Lower Bridge-street, Chester, 18th January, 1864

CONTRACTS.

TO BUILDERS.—CHINNOR, OXON.—Parties willing to CONTRACT for the RESTORATION of, and other WORKS at Chinnor Church, in the county of Oxford, are hereby informed that the drawings, specifications, and conditions of contract thereof, may be seen at the National School Room, Chinnor, on and after the 14th instant.—Tenders properly endorsed and sealed, to be sent to the Rev. F. BUTTENSHAW, Chinnor, Tetsworth, on or before the 30th instant.—The Committee do not bind themselves to accept the lowest or any other Tender.

EDWARD BANKS, Architect.

Wolverhampton, January 6th, 1864.

LANCASHIRE and YORKSHIRE RAILWAY. The Directors are prepared to receive TENDERS for the CONSTRUCTION of a BRANCH RAILWAY from Lockwood to Meltham, near Huddersfield. Length about 3½ miles.—Plans and Specifications may be seen and forms of Tender obtained at the Engineer's Office, Hunt's Bank, Manchester, on and after MONDAY, the 4th JANUARY proximo, and Tenders, properly endorsed and addressed to the Directors, must be in the hands of the Secretary not later than MONDAY, the 15th FEBRUARY, 1864.

Manchester, December 18, 1863. WM. S. LAWN, Secretary.

CROYDON LOCAL BOARD of HEALTH.

The STONE MERCHANTS and OTHERS.—Persons desirous of CONTRACTING with the Croydon Local Board of Health for the DELIVERY at Croydon of a quantity of 4 in. by 12 in. and 6 in. by 12 in. PURBECK KERBING, and 12 in. by 6 in. GRANITE KERBING, to receive forward Tenders to me, on or before the 1st day of FEBRUARY next. The Board do not bind themselves to accept the lowest or any Tender.

BALDWIN LATHAM, Engineer and Surveyor.

Engineer and Surveyor's Office, Townhall.

TENDERS.—Notice is hereby given, that the Hastings Local Board of Health are ready to receive TENDERS from persons desirous of CONTRACTING with them for the SUPPLY of 150 Cast-iron GULLY GRATINGS and FRAMES. The specification and models may be seen, and further particulars had, on application at the Town Clerk's Office, Pelham-street, Hastings, where Tenders, duly signed, must be delivered before TEN o'clock of the morning of MONDAY, the 1st day of FEBRUARY next. The Local Board do not bind themselves to accept the lowest or any Tender.

ROBERT GROWSE, Town Clerk.

Hastings, January 19th, 1864.

METROPOLITAN IMPROVEMENTS.—SOUTHWARK STREET.—The Metropolitan Board of Works hereby give notice, that they will meet at the Office, in Spring-gardens, Charing-cross, on WEDNESDAY, the 2nd MARCH, now next, at TWELVE o'clock at Noon precisely, when will be prepared to open TENDERS by parties who may be willing to take on BUILDING LEASES all or any of certain PLOTS of GROUND, situate on the north and south sides of Southwark-street, from Blackfriars Road to Blackfriars road. Particulars, conditions, and form of Tender, and every information may be obtained in the Superintending Architect's Office, at the Office of the Board, on and after the 1st of FEBRUARY next, between the hours of NINE a.m. and FOUR p.m. The Tenders must be on the printed form supplied at the Office of the Board, and be delivered under sealed covers, endorsed, "Tender for Ground in Southwark street," and addressed to the Clerk of the Board, at the Office of the Metropolitan Board of Works, Spring-gardens, S.W. before TWELVE o'clock at noon, on the said 2nd MARCH next, and no Tender will be received after that hour. The Board do not bind themselves to accept the highest or any Tender.

JOHN POLLARD, Clerk of the Board.

Spring-gardens, Charing cross, 9th January, 1864.

[For remainder of Contracts see next Page.]

CONTRACTS.

TO BUILDERS, &c.—Notice is hereby given, that plans and specifications for the ALTERATION and RESTORATION of the PARISH CHURCH of Baldon Toot, six miles from Oxford, will be lying at the School-house from the 25th to the 30th proximo, both days inclusive; and all persons desirous of CONTRACTING for the works must send in sealed TENDERS, directed to the Rev. EDWARD PEEL, The Vicarage, Baldon Toot, on or before the 14th day of FEBRUARY next. Neither the lowest Tender nor any will necessarily be accepted. The contractor must be prepared, if required, to enter into the usual legal bond for the due execution of the work, with two good and approved securities.

CROYDON LOCAL BOARD of HEALTH. Persons desirous of CONTRACTING with the Croydon Local Board of Health for the MANUFACTURE and DELIVERY at Croydon, of about SEVEN MILES of FREE INCH IRON WATER PIPES, and a small quantity of other sized pipes, can inspect the specification at my Office, on or after the 2nd day of JANUARY next, and sealed Tenders, endorsed "Tenders for Iron Pipes," are to be forwarded to me, on before the 1st day of FEBRUARY ensuing.—The Local Board do not bind themselves to accept the lowest or any Tender.
BALDWIN LATHAM, Engineer and Surveyor.
Townhall, Croydon, January 21, 1864.

TO BUILDERS.—Such Persons as may be desirous of UNDERTAKING the several WORKS and REPAIRS that may be required by the War Department to the BARRACKS at the Depôt, from the 30th MARCH, 1864, to the 31st MARCH, 1865, may be furnished, by payment of seven shillings and sixpence, with the printed Schedules of Prices and Conditions of the Contract on persons application at this Office, between the hours of TEN and FOUR daily (Sundays excepted), up to the 10th FEBRUARY next.
The Tenders to be delivered before TWELVE o'clock at noon on SATURDAY, the 13th day of FEBRUARY, 1864, at the War Office, Pall Mall, London, addressed to the Director of Barracks, and endorsed "Tender for Artificers' Work, Chichester."
The Secretary of State for War reserves to himself the right of rejecting the whole or any of the Tenders.
J. W. GORDON, Colonel,
Commanding Royal Engineer.
Royal Engineer Office, Portsmouth, 17th Jan 1864.

LEAD-PIPING and WATER FITTINGS. The Directors of the Fylde Water Works Company are prepared to receive TENDERS for the Supply of the above Articles during the current year. The quantities and descriptions required will probably be as follows:—

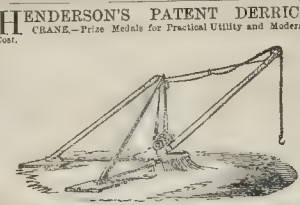
Description.		¾ in. diam	½ in. diam	¼ in. diam.	1 in. diam.
Lead pipes	Quantity in tons	45	10	24	25
Ditto ...	Weight in lb. per yard	9½	7	10	14
Brass ferrules	Quantity in gross	4	4	2	1
Brass stopcocks	Ditto ..		6	1	½

The prices to include delivery at Blackpool, Fleetwood, Lytham, or Kirkham Stations, in such quantities as may respectively be required from time to time. Each delivery to be equal to the sample to be sent. Samples of each diameter of pipe, and of each size of ferrule and stopcock, to be sent in with the Tender to Mr. T. A. WILKINSON, Secretary to the Company, Fylde Water Works Office, Kirkham, on or before the 1st day of FEBRUARY next.

THE VESTRY of the PARISH of LAMBETH.—To SEWER CONTRACTORS and OTHERS.—The Committee for Sewers, &c. hereby give notice, that they are prepared to receive TENDERS from persons or parties, who may be willing to CONTRACT for CONSTRUCTING 15,700 feet, or thereabouts, of Brick SEWERS, together with other Works in connexion with the same, in Cold Harbour-lane, Norwood-lane, Knatchbull Road, Hill-street, Norwood, and Chapel-road, in the parish of Lambeth, and the maintenance thereof in complete repair for twelve calendar months. Plans, sections, and specifications may be inspected, and a form of Tender, and further particulars obtained, from Mr. HUGH McINTOSH, Surveyor, at the Vestry Hall, Kennington-green, on and after MONDAY, the 25th inst., between the hours of TEN a.m. and FOUR p.m. Sealed Tenders, addressed to the Clerk of the Vestry, and endorsed, "Tender for Sewer Works," are to be delivered at the Vestry Hall, not later than FOUR o'clock in the afternoon of MONDAY, the 8th inst., and no Tender will be received after that hour. The parties tendering must be in attendance at SEVEN o'clock in the evening of the same day, when the Committee will meet to open the Tenders. The Committee do not bind themselves to accept the lowest or any Tender, and the party whose Tender shall be accepted will be required to enter into two approved sureties for the proper performance of the Works.—By order,
THOS. HOFFEY, Clerk to the Vestry.
Vestry hall, Kennington-green, 11th January, 1864.

THE LOCAL BOARD of HEALTH for the District of LEAMINGTON are prepared to receive TENDERS for the execution of WORKS required in the Construction and Sewerage of about 7 miles of Principal Streets, including the Macadamization of the Carriage-ways, the Paving and Guttering of the Footways, the Construction and Paving of about 2,000 lineal feet of Passages, and the laying of about 10,000 lineal feet of 9 inch Socket pipe Sewers, with the necessary manholes, ventilating shafts and grids in connexion therewith, according to the plans, sections, and specifications prepared by Mr. A. MORGAN, C.E. the Surveyor of the Board, and which, with samples of the material to be used, drawings, and forms of Tender may be obtained at his Office, Town Hall, Leamington, between the hours of Ten and One of the clock, on and after FRIDAY, the 22nd instant; and Tenders to be delivered at my Office on or before TEN o'clock in the FORENOON of TUESDAY, the 2nd day of FEBRUARY, 1864. The Board do not bind themselves to accept the lowest or any Tender.—By order,
E. A. WALLINGTON (Solicitor), Clerk.
Town Hall Leamington, 5th January, 1864.

NORTH EASTERN RAILWAY.—DARLINGTON SECTION.—The Directors are prepared to receive TENDERS for the following Works, viz.: ALTERATIONS and ADDITIONS to DALSTON STATION, consisting of Bricklayer and Mason's Work, re-slating and extending the Platforms and Offices: Carpenter and Joiner, Plumber and Painter's Work, in Roofs and Offices; and a large quantity of Ironfounder and Glazier's Work, in general Extension of Station.—ALTERATIONS and ADDITIONS to MIDDLESBRO' STATION, consisting of a New Carriage Shed; sundry Bricklayer and Mason's Work, in altering and extending the Platforms and Offices; Carpenter and Joiner, Plumber and Painter's Work, to Roofs and Offices; and a large quantity of Ironfounder and Glazier's Work, in covering Extensions, Platforms, &c. Plans and specifications of the above may be seen at the Architect's Office, North-gate, Darlington, on and after WEDNESDAY, the 27th day of JANUARY, until SATURDAY, the 30th day of JANUARY, 1864. Tenders to be addressed to the Secretary, and delivered at the Railway Office, Darlington, not later than MONDAY, FEBRUARY 15th, 1864. The Directors do not hold themselves bound to accept the lowest or any Tender. (Signed) THOS. MACNAY, Secretary.
Railway Office, Darlington, January 21, 1864.
N.B.—Bills of Quantities may be obtained of Messrs. O. J. & J. SHOWELL, 54, Great Ormond-row, Manchester, or at the Architect's Office, Darlington.

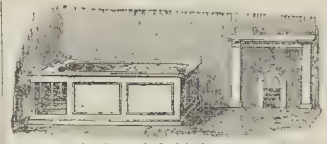


TENDERS are required for a DRILL-SHED, ARMOURY, and SERGEANTS' HOUSE, to be erected at Tetbury. Plans and specifications to be seen, with all particulars, at the Surveyor's Office of the Local Board, Tetbury, on and after Monday next. Tenders are to be addressed to the Clerk of the Board, at the Office, on or before WEDNESDAY, the 27th instant.

TEMPORARY IRON BUILDING FOR SALE. The Metropolitan Board of Works hereby give notice that they are prepared to receive OFFERS for the PURCHASE of an IRON BUILDING of the following dimensions, viz. 70 feet by 30 feet, and 12 feet to the roof plate. The building was constructed by Messrs. Heming for the purpose of testing gas-meters, is situate in King-street, Deptford-green, and may be viewed any day between NINE and FIVE o'clock.—The Tenders are to be addressed to the Clerk of the Board, at the Office, on or before TUESDAY, the 2nd FEBRUARY next, and the building must be removed soon after that date.
JOHN FOLLAND, Clerk of the Board.
Spring-gardens, January 19th, 1864.

TO SAW-MILL PROPRIETORS, CONTRACTORS, and OTHERS.—TO BE SOLD, a bargain, a splendid TIMBER FRAME. Will take in a log 2 feet 6 inches square. Also a light DEAL FRAME, all iron, with foundation stone.—For price and particulars address C. W. TODD, Auckland, Wanderworth Common.

TO ARCHITECTS, BUILDERS, and OTHERS.—FOR SALE, about TWENTY ornamental FLUTED IRON COLUMNS, 9½ feet high, with base plates and pedestals complete. They will be sold cheap.—Apply to DRAY, TAYLOR, & CO. No. 4, Adelaide place, London Bridge, where a specimen can be seen.



HENDERSON'S PATENT DERRICK CRANE.—Prize Medals for Practical Utility and Moderate Cost.

HENDERSON'S PATENT DERRICK CRANE, so extensively used in the building of the Exhibition, London, can always be had from the Makers, from 15cwt. upwards, Portable, Foundry, Forge, Wharf, Quarry, Warehouse, and other descriptions of Cranes; also Steam Winches and Cranes for the Derrick principle. Water Companies and others can also be supplied with the Improved Sluice Valves.—For further particulars apply to BOWSER & CAMERON, Makers, Springfield Iron Works, M'Neil-street, Glasgow.

NAILS and IRONMONGERY from BIRMINGHAM direct. Builders, Contractors, and Others, supplied with Nails, Iron, and Ironmongery of every description, at the LOWEST BIRMINGHAM PRICES. A complete List of which will be forwarded upon application to FRANCIS BIANCHI (late Blyth & Bianchi), Nail Manufacturer and General Factor, BIRMINGHAM, and 16, Gresham street London, E.C.

J. TYLOR & SONS' PATENT BATH APPARATUS.

The bath and boiler may be fixed in the same or separate rooms, any where below the level of cold-water cistern. Open or close fire at pleasure. Bath fitted complete. Boiler required.
Estimates given from architects' drawings, or by inspection of buildings.
Cata. ogue, containing Nine Illustrations of different methods of heating baths, sent on application to the Manufacturers, J. TYLOR & SONS, Warwick-lane, Newgate-street, London.

LAMBERT, BROTHERS, Manufacturers of Lap-welded Boiler Tubes, Locomotive and Marine Ends, Fittings, Wrought-iron Welded Pipe, for Steam, or High pressure Water and Gas; High-pressure Steam and Water Valves, Hydraulic Machinery, Pumps, Closets, &c.; Stocks, Taps, and Dies, Chandeliers, and Patent Metallic Bedsteads.—WALSALL. New Illustrated GAZELIER CATALOGUE, complete, price 1s. to the trade post-free).

GAS.—SAVING of 40 PER CENT. NORDHOFF & CO.'S PATENT GAS CARBURETTING APPARATUS offers the following highly important Advantages to Consumers of Gas:—
1. Great Economy—a saving of at least FORTY per Cent.
2. Perfect Purity of the Carburetted Gas.
3. Threefold Increase of the Intensity of Light.
4. Simplicity and Safety of the Apparatus.
5. Cutting up of Stopper.
6. No Alteration in the Gasfittings required.

THE INTERNATIONAL EXHIBITION PRIZE MEDAL, AWARDED 1862.
ESTABLISHED 1744.
AUSTIN'S IMPERIAL PATENT SASH and BLIND LINES.
To BUILDERS, CARPENTERS, and BLIND MAKERS.
J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his
IMPERIAL PATENT FLAX SASH-LINES,
of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.
They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

OLD SAINT PANCRAS ROAD, LONDON, N.W.

APPROVAL OF THE ROYAL VETERINARY COLLEGE.

THE MEDALS OF ENGLAND AND FRANCE,

And the Medals and High Recommendation of the Royal Agricultural Societies of England and Ireland.

SECURED BY EIGHT SEPARATE PATENTS. LATEST, 1863.

PATENT WROUGHT-IRON STABLE FITTINGS

SHOULD BE ADOPTED FOR THE FOLLOWING REASONS, viz.:—

That the BREAKAGES in Cast-Iron Fittings are numerous, and that one fracture from a kick, or other cause, may occasion an injury to a Horse, and involve a loss equal to the entire expense of fitting up the Stable. The fear of this has led to the use of wood, and, in the case of Cast-Iron GUTTERS, to the adoption of another and less effective mode of draining.

PATENT ENAMELLED TOP PLATE MANGER, with RACK & WATER-TROUGH,

The whole of which, except the Rack, being enamelled, can be kept as clean as a DINNER PLATE.

THE HALTER BALL, ATTACHED BY A NEW IMPROVEMENT, WORKS NOISELESSLY, AND ALMOST WITHOUT FRICTION.

PATENT FASTENINGS FOR THE DOORS OF LOOSE BOXES.

These Catches and Hangings work easily, are self-acting, and cannot be put out of order: by their use all projections by which horses are often blemished are rendered impossible; advantages peculiarly their own.

THE PATENT HARNESS FITTINGS

Keep the Harness and Saddles in shape, and are constructed so as to admit the air getting to the underside of them when hung up, thereby insuring a quick and perfect airing from any wet or moisture.

EVERY DESCRIPTION OF STABLE FURNITURE.

ILLUSTRATED LISTS ON APPLICATION.——INSPECTION OF SHOW-ROOM REQUESTED.

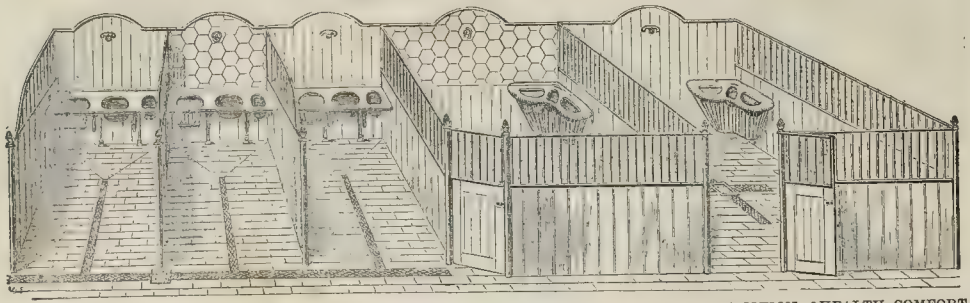
LONDON, 1851. PARIS, 1855. LONDON, 1862.

AWARDED TO

COTTAM & COMPANY,

No. 2, WINSLEY-STREET, LONDON, W.



FOR PROGRESSIVE AND GENERAL IMPROVEMENTS IN

STABLE FITTINGS AND HARNESS BRACKETS.

PATENTEES AND ORIGINAL INVENTORS OF

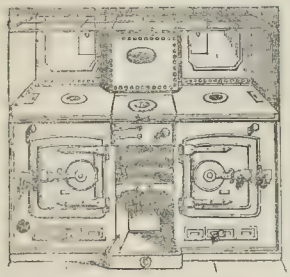
THE IMPROVED SYSTEM OF STABLE AND HARNESS FITTINGS,

PATRONISED BY THE ENGLISH AND FRENCH GOVERNMENTS, AS WELL AS BY THE PRINCIPAL NOBILITY, GENTRY, AND HUNTING ESTABLISHMENTS IN THE KINGDOM.

SECURITY FROM ACCIDENT by the use of the Patent Halter Guide and Improved Curved Top-plate; PROMOTION of HEALTH, COMFORT, and CONDITION, by the cleanliness and power of resisting infection of the Mangers and Troughs; and also of the Patent Drop Cover, to curtail the quantity of water to be imbibed. ECONOMY in the USE of FOOD, from the improved formation of the Fittings, and by means of the Patent Portable Seed-box, are some of the peculiar recommendations of Cottam's Patent Componised, Enamelled, and Galvanized Iron Fittings for Stalls and Loose Boxes.

COTTAM'S PATENT COMBINED SADDLE and HARNESS BRACKETS; IMPROVED SURFACE GUTTER, WITH MOVEABLE SAFETY COVERS; Sanitary Traps, Cheap and Durable Corn-bins, and every Article requisite for the Stable and Harness-room.

IRON GATES, FENCING, and HURDLES MADE by MACHINERY.



COTTAM'S newly-invented REGISTERED NOISELESS MANGER SHACKLE and GUIDE FOR HALTER-STRAP, and IMPROVED VENTILATING HARNESS BRACKETS, are only to be obtained from the Inventors, and can be seen in use at their Manufactory.

COTTAM & CO. exhibit for inspection, at their Iron Works, 2, Winsley-street, W., an extensive range of full-sized Stalls, Loose Boxes, and Harness Rooms, the most complete that can be imagined.

ILLUSTRATED CATALOGUES and LITHOGRAPHS free, on application to COTTAM and CO. 2, WINSLEY STREET, Oxford-street, London, W.

COTTAM & CO.'S only address in London, is 2, WINSLEY STREET, W.

N.B. WINSLEY STREET IS THE STREET OPPOSITE THE PANTHEON.

FENDERS, STOVES, FIRE-IRONS, AND CHIMNEY-PIECES.

Buyers of the above are requested, before finally deciding, to visit

WILLIAM S. BURTON'S SHOW-ROOMS.

They contain such an assortment of FENDERS, STOVES, RANGES, CHIMNEY-PIECES, FIRE-IRONS, and General IRONMONGERY, as cannot be approached elsewhere, either for variety, novelty, beauty of design, or exquisiteness of workmanship. Bright Stoves, with ormolu ornaments, 3*l.* 15*s.* to 33*l.* 10*s.*; Bronzed Fenders, with standards, 7*s.* to 10*l.*; Fire-irons, from 2*s.* 3*d.* the set to 4*l.* 4*s.* The Burton and all other Patent Stoves with radiating hearth-plates.

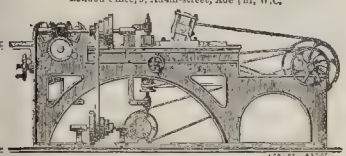
TO BUILDERS, JOINERS, CONTRACTORS, &c.

THE "GENERAL JOINER."

SAMUEL WORSSAM & CO. having long felt the importance of introducing a LABOUR-SAVING MACHINE, which by combining several operations at a moderate cost, should meet the requirements of builders and others engaged in the conversion of timber, beg to offer for this purpose their "General Joiner" as above, which in its present greatly improved form will, with 2-horse power, do the work of at least fifteen skilled joiners, in SAWING, CROSS-CUTTING, and SQUARING, PLANING, and THICKNESSING, MORTISING, TENONING, GROOVING, TONGUEING, RABBETTING, BORING, BEADING, MOULDING, CHAMFERING, &c. &c.—For priced illustrated circulars, apply to S. WORSSAM & CO. Saw-Mill Engineers, King's-road, Chelsea (sole manufacturers), where the "General Joiner," and samples of the work may be seen.



PRIZE MEDAL, LONDON, 1862.

THOMAS ROBINSON & SON,

SAW-MILL ENGINEERS,

ROCHDALE, NEAR MANCHESTER.

London Office, 9, Adam-street, Adelphi, W.C.

Patent MOULDING and PLANING MACHINE, for Planing Floor and Match Boards, and working Mouldings.

Manufacturers of Sawing, Planing, Moulding, and Wood-working Machinery of every description, suitable for Builders, Contractors, &c. Steam Engines and Boilers, Shafting, Gearing, &c.

Full sets of Wood-working Machinery to be seen in operation daily at the Works, Rochdale.

PERIN'S PATENT

FRENCH BAND SAW BLADES.

SAMUEL WORSSAM & CO. having purchased of M. Perin, of Paris, the sole right to import and sell his BAND SAW BLADES throughout the United Kingdom, beg to announce that they are now in a position to supply these Saws from 1-16th of an inch to 8 inches in width, and up to 50 feet in length.

The vast superiority of Perin's Band Saws over any others in point of finish, toughness, durability, and evenness of temper, is now everywhere admitted.

S. W. & CO. keep a large stock of all sizes up to 2 inches wide, from which they can supply orders to any part of the kingdom within twenty-four hours' notice.

For Price Lists, apply to

HOBBS, HART, & CO.'S

MACHINE-MADE LOCKS AND STREET-DOOR LATCHES.

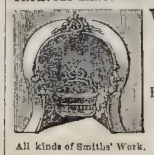
These Locks are recommended for all purposes requiring good ordinary security combined with economy of price and durability of wear; as, by means of machinery, a faultless accuracy is arrived at which by hand-labour would be impossible except at a greatly increased cost.

The security of these Locks consists in a series of Levers that have to be raised to unequal positions by the bits of the key before the bolts can pass. These will bear comparison with those at treble their cost.

These Locks are made from two to five levers, and also in suits to differ, with master-keys to pass.

The retail prices for Cabinet purposes is from 2s. to 4s. each; for Room Doors, 4s. to 9s. 6d. each; Street Door Latches, 7s. 6d. to 18s. each.

The 2-bolt 4-lever Mortise, with Hobbs & Co.'s Patent Follower, price 8s.



HOBBS, HART, & CO.'S PATENT PROTECTOR LOCKS.

300 Guineas were offered in the late Exhibition to any one who could Pick these Locks in thirty days. Their speciality consists in their combining the two essentials of security, viz.—protection against picking, by means of their Patent Moveable Lever Protector, and protection against illicit tampering with the Lock through the key hole, and also tampering with the key, by means of their Patent Nozzle Protector. These all-important principles are the special and peculiar features of HOBBS, HART, & CO.'S Patent Locks. These Locks vary in price from 10s. to 50s. each, with solid keys. For prices with changeable keys, see 16-paged Illustrated List of Locks, Iron Door Safes, &c.

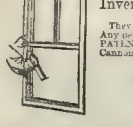
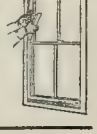
6, 7, & 15, LEICESTER STREET, LEICESTER SQUARE, LONDON.
A Prospectus, with full Description and Price of the above, will be sent per Post on application.



THE DENNETT ARCH.

Allowed to be the cheapest fireproof construction known, and used with the greatest success for the last ten years in the Midland Counties, and has been adopted by G. G. Scott, esq. for the New Foreign Offices, used in any form of arch, grain or dome; turned to any length, width, or height, forming a perfect floor and ceiling in one mass, from 9½ inches in the crown, to any required thickness.

Address—A. & R. DENNETT & CO. NOTTINGHAM.



TESTIMONIAL.—"I have made use of Messrs. Dennett & Co.'s material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength, and its extreme convenience of application. I have made use of it in positions in which I should have found it difficult to introduce any other fireproof material, and it has this advantage, that the arches constructed of it are so entirely in one mass that they cover the space like a compact shell or inverted basin, and are, consequently, almost wholly free from lateral pressure.
"GEO. GILBERT SCOTT, 20, Spring Gardens, London."

J. GURMAN,

Inventor and Patentee of a New SASH POCKET and Fittings,

For Weighted Balance Sashes, for Cleaning, Repairing, or Painting Windows.
They can be taken out in a minute, and replaced in same time. Old Windows can be altered.
Any person allowed to work the Patent, on purchasing the Patent Pocket and other Fittings of the PATENTEE, 4, ONSLOW ROAD Southampton; or of Mr. G. BRADBURY, 11, GARLICK HILL, Cannon street, London, where Windows may be seen, and information obtained.
Also of the following Agents:—

FIRE-PROOF CONSTRUCTION.—

FOX & BARRETT'S PATENT.

This improved system of fire-proof construction has been most extensively adopted, and its application has been extended to nearly EVERY DESCRIPTION OF BUILDING, whether public or private.
The system combines ECONOMY with great simplicity of construction, perfect security from fire, increased durability, and many other important advantages.
The floors and roofs are formed by a combination of joists of wrought or rolled iron with concrete, so constructed that each floor becomes in effect a beam of artificial stone with ribs of iron; the structure possessing great strength and rigidity, and forming a fire-proof foundation adapted to receive a finished surface, either of the ordinary flooring boards, or of cement, asphalte, tiles, slate, or other material.
Some of the largest and most important buildings in the kingdom are now in course of erection upon this principle, which is recommended to the notice of all who are interested in building, both as supersuding the necessity for cast-iron girders and brick arches, and as bringing the great desideratum of fire-proof construction, even for ordinary dwelling houses and domestic buildings, within the reach of every one.
Further information may be obtained of the Proprietor of the Patent,

MR. BARRETT,
12, YORK BUILDINGS, ADELPHI

ROOFING METAL

(WETTERSTEDT'S PATENT or MARINE),

In sheets 2lb. and 3lb. per square foot, 9 feet long by 3 feet wide.

NUT PLATE.

J. B. SCAMMELL & CO. (late Thomas Pugh & Co.)

WHOLESALE IRONMONGERS,

13, KING STREET, SNOW HILL, LONDON.

We invite particular attention to the PATENT LOCK FURNITURE, which we do not hesitate to say is the most perfect article now manufactured, great improvements having been recently made in it. It has been extensively used in Public and Private Buildings, in Her Majesty's Pavilion and Camp at Aldershott—alone, many hundred sets without one single failure. It is applicable to all Locks and Latches, both Rim and Mortise, and effects a most secure fastening, without any screw in the neck of the knob. Perfect action guaranteed in both Locks and Furniture, if the Locks are of our own manufacture.

New rich Designs in Glass, China, Brass, Bronzed, Gilt, Carved Woods, Inlaid, &c. &c. or to any Design.

THIS FURNITURE MAY BE HAD WITH PLATES OR NUTS.

A most complete and extensive stock of every description of Locks, Latches, Brass Foundry, and Ironmongery, required for Buildings, of the best quality manufactured, at the lowest wholesale prices.

*** Illustrations and Particulars sent on application.

Near Grange-road, Bermondsey.

IRON CASTINGS, WROUGHT and

CAST-IRON GIRDERS FLITCHES, and TANKS. Iron Roofing, and every description of Smith and Founders' work. Estimates given.

JAMES HAYWOOD, JUN.

PHŒNIX FOUNDRY AND ENGINEERING WORKS, DERBY.

IRON ROOFING of CORRUGATED IRON,

Wrought Iron, principal Roofs covered with Slates, Iron Bridges, Girders and Railings; also Portable Buildings for Dwellings, Farm Purposes, Churches, Chapels, Schools, Theatres, Concert or Dancing Rooms, &c. suitable to all Climates, fixed complete in Town or country, or packed for exportation.

For Designs and Estimates apply to

RANDAL STAP, Contractor,

No. 32, KING WILLIAM STREET, E.C.

Where numerous Drawings and Photographs may be seen.

N.B. The Iron Buildings manufactured by R. STAP are not fixtures on Leasehold Property.

CANNON IRON FOUNDRY, 156, Goswell-

street, St. Luke's.—JONES & SLAXTON, having made great additions to their STOCK of PATTERNS, beg to inform the Trade that they can now supply them with Plain and Ornamental Iron Columns, Girders, Railings, Gates, Iron Coping, Balconies, Window Guards, Verandahs, Ornamental Staircase Panels, Iron Staircases, Tomb Enclosures, Trellis Panelling, Lamp and other Brackets, Sash Levers, Newel Bars, Water closet Work, Area Gratings, Fly and other Wheels, Wheel Plates, &c.

BAKERS' OVEN WORK, Forge Backs and Troughs, Rain water Pipes and Gutters, Sash-Weights, Furnace Bars, Stoves, Ranges, &c. always in stock.

CAST-IRON PIPES, IRON-WORK FOR OVENS, &c.

SMOKY CHIMNEYS. — The

best Cure is the PATENT ALBERT CHIMNEY CAP, 7s6 on Buckingham Palace; in use also at St. James's Palace, Windsor Castle Government buildings, mansions, halls, club-houses, and lighthouses in general. Prospectuses on receipt of two postage stamps.

JAMES BARTON,

Iron Works, 370, Oxford-street, W.

N.B. Manufactory for the Patent Stable Fittings and Enamelled Mangers.

SMOKY CHIMNEYS

WOOD'S

PATENT CHIMNEY-TOP

Is simple in construction and certain in effect. It has a good shape, is durable, and easily swept by the sweeps' machine.

Price 30s.

Sent to all parts of the kingdom upon receipt of money order, addressed to the

PATENTEE, CAMDEN MANUFACTORY, CHISLEHURST, KENT.

SMOKY CHIMNEYS.

S. DEACON

Respectfully invites the attention of Architects, Builders, &c. to his

PATENT LOUVRE CHIMNEY CAP,

which has been in use some time with perfect success, many curing chimneys where other caps have been of no avail.

The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of misplacing it; an increased up current, and the impossibility of a down one.

Prospectus forwarded on receipt of Postage Stamp, by

S. DEACON,

59, ALMA STREET, HOXTON, N.

MANUFACTORY:

HEMSWORTH STREET, SAINT JOHN'S ROAD, HOXTON, N.

ROBERT MACLAREN & CO.

EGLINTON FOUNDRY, GLASGOW.

Manufacturers of all sizes of CAST IRON MAIN PIPES, for Gas or Water, by an IMPROVED PATENT.

GENERAL IRON FOUNDERS, GAS ENGINEERS, and WROUGHT IRON TUBE MAKERS

RYFFEL'S PATENT

HYGEIAN STOVE, heated either by coal or gas. With one pennyworth of coal this Stove affords for twenty-four hours a genial, healthy, and uniform temperature, free from any smell or decomposition of the air. It was favourably noticed in the "The Lancet" of February 1st, 1862, and recommended as the only stove particularly suitable for the bed or sick-room.—For particulars apply to the Depôt, where the Stove is sold and may be seen in action.

RYFFEL BROTHERS,

5, Upper Stamford street, Blackfriars, London.

TO IRONMONGERS, BUILDERS, &c.

PATENT WROUGHT-IRON WELDED

TUBE for GAS; Galvanised ditto, for Water; High-pressure Cocks, &c. Manufactures of Dr. Arnott's Improved Ventilators.

HULETT & CO. 85 High Holborn.

LIGHTNING CONDUCTORS.

R. S. NEWALL & CO. Patentees of the COPPER ROPE LIGHTNING CONDUCTOR, supply the same, with the point and all staples, complete for fixing, at the following prices:—

Three-eighths-inch diameter	1s.	0d. per foot.
Half-inch diameter	1s.	6d. "
Five-eighths-inch diameter	2s.	0d. "

R. S Newall & Co.'s Patent Copper Rope Lightning Conductor is being applied by architects, engineers, and scientific men, in all parts of the world.

Offices—150, Strand, London.
" Gateshead-on-Tyne.
" 87, Dale-street, Manchester.
" 68, Anderston-quay, Glasgow.
" 17, South Castle-street, Liverpool
" Exchange-buildings, Dundee.
" 7, Frederick-street, Aberdeen.

PROTECTION from LIGHTNING.

HART & SON

Beg to call the attention of Architects, Builders, and the public to their

IMPROVED LIGHTNING CONDUCTORS

(SPRATT'S PATENT).

As presenting the MOST EFFECTIVE MEANS of OBTAINING SECURITY from LIGHTNING. They are economical, easily fixed, and APPLICABLE TO ALL BUILDINGS, including Private Houses, Churches, Chimney-Shafts, Ships, Powder Magazines, &c. &c.

Price lists and estimates on application.

HART & SON,

WHOLESALE AND MANUFACTURING IRONMONGERS,

53 to 58, WYCH ST. STRAND, LONDON, W.C.

GARDNER'S SUNLIGHT

GAS BURNER and FITTING ESTIMATES

Offer important advantages to Architects, Builders, and the Public generally.—GARDNER'S, No. 453, Strand, Charing cross, four door from Trafalgar square, London.

ESTABLISHED 1752.

A PRIZE MEDAL for SUPERIOR LOCKS

WAS awarded to J. H. BOOBBYER, at the Great Exhibition of 1851, who invites the attention of Builders, &c. to his Stock of Ironmongery, Brass Foundry, Nails (wrought and cut), Copper, and Zinc; Patent Locks of all descriptions; China, Glass, and Wood Furniture, of all kinds, with Patent Sliding Spindles; Dr. Arnott's Ventilators, &c.; and the New Registered Venetian Ventilator, so much admired, 6s. 6d. each.

J. H. BOOBBYER (late STURCH & BOOBBYER), established nearly 200 years, for the supply of GOODS of the BEST MANUFACTURE, at the LOWEST PRICE.

14, Stanhope-street, Newcastle-street, Strand, London, W.C.

BATH STONE OF BEST QUALITY.

RANDELL & SAUNDERS, Quarrymen and Stone Merchants, Bath.

List of Prices at the Quarries and Depôts, also Cost for Transit to any part of the United Kingdom, furnished on application to BATH STONE OFFICE, CORSHAM, WILTS.

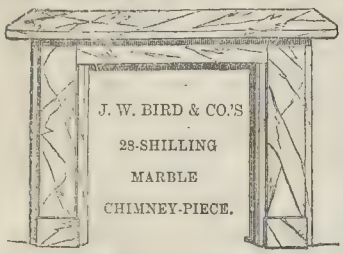
BATH STONE OF THE BEST QUALITY.

PICTOR & SONS, Quarry Proprietors and Stone Merchants, Bath.

Lists of Prices at the Quarries and Depôts, also Cost of Transit to all parts of the Kingdom, forwarded on application to BATH FREESTONE WORKS, BOX, NEAR CHIPPENHAM, WILTS.

STATUARY AND OTHER MARBLE CHIMNEYPIECES.

ARCHITECTS, BUILDERS, and MASONS will find at



W. WILLETT'S SHOW-ROOMS, MARYLEBONE ROAD,

OPPOSITE THE YORKSHIRE STINGO,

A LARGE ASSORTMENT of STATUARY and COLOURED MARBLE, also ENAMELLED SLATE and STONE CHIMNEYPIECES, at Prices to command their Orders.

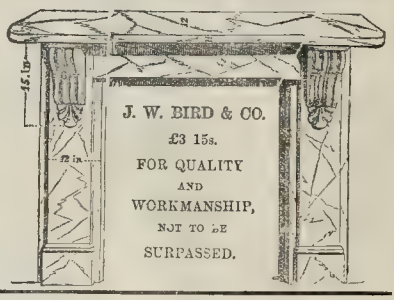
CARVED TRUSS STATUARY MARBLE CHIMNEYPIECE, 14-in. PIERS, FOR £6.

MARBLE & STONE CHIMNEY-PIECES FOR THE MILLION

PRICE LIST ON APPLICATION.

A Stock of 500 always to choose from at

J. W. BIRD & CO.'S,
THE EMPORIUM,
145 & 143½, EUSTON ROAD,
N.W.



A Marble Box Chimney, with 8-inch piers, as Illustrated, for 28s. and fitted to any opening up to 3 feet square.

STONE DITTO, WITH BEAUTIFUL MOULDED CAPS, FOR SEVEN SHILLINGS.

Monuments and Tablets in great variety, equally low in price.

Masons' Work of all kinds contracted for and executed with despatch, in Town or Country.

A VACANCY FOR AN OUT-DOOR APPRENTICE

IMPORTANT TO ARCHITECTS, ENGINEERS, BUILDERS, RAILWAY, AND OTHER COMPANIES.

VIEILLE MONTAGNE ROOFING ZINC.

Company's General Agency, 12, Manchester Buildings, Westminster.

Zinc properly laid has been proved by most extensive and long experience in France, Belgium, and Germany to be a most secure, durable, and economical covering, and is now preferred to all other materials for roofs. Its extreme lightness makes it most valuable for covering buildings requiring large spans with comparatively light framing. On a rough calculation it may be estimated that not less than 41,000,000 square feet is the average quantity of Roofing surface now annually covered in the above countries alone. Within the last few years persevering efforts have been made to introduce into England proper workmanship, in accordance with the principles which are observed on the Continent, and which alone can secure the sound and perfect construction of a Zinc roof. To aid in extending as much as possible the knowledge of these simple rules, models showing all the details are to be seen in the Architectural Exhibition in Conduit-street, and the following, selected out of a very great number of recently constructed roofs, are referred to as examples:—The Patent Granary, West-India Docks; Copenhagen Works, Limehouse; a private house in Holland Park; Homes for Poor Merchants' Clerks, Muswell-hill; a large Warehouse, 77, Thames-street; Ship roof, Sheerness Dockyard; the Victoria Station, Pimlico; the Stations in the Metropolitan Railway; the Stations of the Madras Railway Company (400,000 feet); the Warehouse of Messrs. Oakes, Brothers, & Co. Madras (20,000 feet); the Refreshment Rooms at the Exhibition; the Verandah of the Horticultural Society's Conservatory; Gloucester Railway Station; Messrs. Horniman & Co.'s Tea Warehouse, Wormwood-street; Messrs. Hoare & Co.'s Brewery, Smithfield; Cape Town and Wellington Railway (60,000 feet); Fifty new Dwelling Houses at Palace Gardens-terrace, Kensington; Twenty ditto, Inverness-terrace, Bayswater.

Plans, Estimates, and all useful information will be furnished, without charge, by applying to either of the Directing Architects.

JAMES EDMESTON, 5, Crown-court, Old Broad-street.
R. G. FISHER, 12, Manchester-buildings, Westminster.

N.B. No covering can be more economical, durable, and secure than Zinc when well laid, but good Zinc badly laid will spoil the roof, and, with a view still further to encourage good work, a special Discount will be allowed to all persons upon the Zinc used in roofs, when certified by either of the above Architects to be properly laid.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Substitute of Barytes from ten to thirty per cent. under the name of "Improved Zinc Paint," or as the manufacturers of such work can produce good work with such Paint. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

NEW WORK BY SIR J. EMERSON TENNENT, K.C.S.

Now ready, a cheap Edition, with Woodcuts, price 7s. 6d.

THE STORY of the GUNS.

By Sir JAMES EMERSON TENNENT, K.C.S., LL.D., F.R.S., &c.

London: LONGMAN, GREEN, & CO. Paternoster-row.

New edition, 12mo. cloth, price 5s.

A BRIDGEMENT of MURRAY'S ENGLISH GRAMMAR. Improved and illustrated, with copious Explanatory Observations, Practical Exercises, Questions for Examination, an Appendix, &c. By the Rev. JOHN DAVIS, M.A.

A new edition, thoroughly revised and corrected, comprising a concise history of the English Language, a List of Synonymes, &c. By a Member of the University.

London: WILLIAM TEGG, Pancras-lane, Cheapside.

THE QUARTERLY REVIEW, No. CCXXIX. is published THIS DAY.

CONTENTS:

I. CHINA.

A LETTER on CORPULENCE, addressed to the Public. By WILLIAM BANTING.

London: HARRISON, 59, Pall Mall, Booksellers to her Majesty and H.R.H. the Prince of Wales.

THE ART-STUDENT: an Illustrated Monthly Journal of the Fine and Industrial Arts, and Guide to their Principles and Practice. To be published on February 1st, 1864, price 6d., stamped 7d.

HALL, SMART, & ALLEN, Publishers, 25, Paternoster-row.

THOMAS TATE'S SCHOOL GEOMETRIES.

Ninth Edition, in 12mo. with Woodcuts, price 3s. 6d.

PRINCIPLES of GEOMETRY, MENSURATION, TRIGONOMETRY, LAND SURVEYING, and LEVELLING: Containing Familiar Demonstrations of the most important Propositions in Euclid's Elements; also Proofs of all the Useful Rules and Formulæ in Mensuration and Trigonometry, and their application to Edinburgh Surveying, and Railway Engineering. By THOMAS TATE, F.R.A.S.

Also, Second Edition, in 18mo. with 261 Woodcuts, price 1s.

TATE'S PRACTICAL GEOMETRY; containing the Construction and Applications of the most useful Problems.

London: LONGMAN, GREEN, & CO. Paternoster-row.

NESBIT'S PRACTICAL MENSURATION AND LAND SURVEYING.

A thoroughly revised Edition, augmented by a Treatise on Levelling, price 6s. bound.

A TREATISE on PRACTICAL MENSURATION, in Ten Parts; containing—

The most approved Methods of Measuration of Haystacks, Drains, Drawing Geometrical Figures, Canals, Mariplits, Ponds, Mill-dams, Timbering, Quarries, Mensuration of Superficies, Coal-heaps, and Cask-staves. Land Surveying. Conic Sections and their Solids. Venting of Solids. The most useful Problems in Use of the Carpenter's Rule. Gauging according to the New Imperial Measures. Timber Measure, in which is shown the Method of Measuring and Valuing Standing Timber. Plane Trigonometry, with its application to the Mensuration of Heights and Distances. Artificers' Works illustrated by the Dimensions and Contents of a House. Trigonometrical Surveys. A Dictionary of the Terms used in Architecture.

By ANTHONY NESBIT.

New Edition, enlarged and much improved. To which is added, a TREATISE on LEVELLING. The Two Treatises illustrated by above 700 Practical Examples and about 300 Woodcuts.

KEY to NESBIT'S PRACTICAL MENSURATION, containing Solutions to all Questions which are not answered in the work; with Reference to the Problems, Rules, and Notes, by which the Solutions are obtained. Corrected to correspond throughout with the Improved Edition of the Treatise. 12mo. price 3s. bound.

Also, just ready, a new Edition of

NESBIT'S TREATISE on PRACTICAL LAND SURVEYING.

London: LONGMAN, GREEN, & CO. Paternoster-row.

TWISDEN'S MECHANICS—CHEAPER EDITION.

Just published, in crown 8vo. price 10s. 6d. cloth.

ELEMENTARY INTRODUCTION to PRACTICAL MECHANICS, Illustrated by Numerous Examples. Being the Second Edition, thoroughly revised, of "Elementary Examples in Practical Mechanics."

By the Rev. JOHN F. TWISDEN, M.A. Professor of Mathematics in the Staff College.

London: LONGMAN, GREEN, & CO. Paternoster-row.

The Builder.

VOL. XXII.—No. 1094.

"Notes on Hospitals."

EVER was change more complete than that which has occurred in hospital building since we initiated in these pages the movement against the defective plans in use, and showed the advantages of the pavilion system of arrangement now universally adopted. When we asserted with reference to the plans determined on for the new hospital at Netley, before the building was out of the ground, that if these were carried out the hospital would kill more than it would cure; that patients would have a better chance of recovery under a tent in a field than in such a structure, it was met with derision, and we received an amount of personal abuse from various quarters which would scarcely be credited if described. We were quite contented to wait; and had not to wait long. In a very few months the objections raised were generally admitted, and a repetition of the errors there fallen into is not likely to occur for some time to come. The efforts made in these pages to set forth a good system of hospital construction were ably followed up by Miss Nightingale, and the publication of that lady's excellent "Notes on Hospitals" settled the question. These "Notes" have grown, and the object of our present writing is to make known to our readers the appearance of an enlarged edition of the book.* It treats the subject under nine heads:—1. The sanitary condition of hospitals; 2. The defects in existing hospital plans and construction; 3. The principles of construction which ought to be kept in view in building new hospitals; 4. Improved hospital plans; 5. Convalescent hospitals; 6. Children's hospitals; 7. Indian military hospitals; 8. Hospitals for soldiers' wives; and 9. Hospital statistics; with an appendix treating of different systems of hospital nursing. It further contains good clear plans of eleven hospitals, many woodcuts, and sketch-plans of London and of Paris, showing the relative position of the larger hospitals and their distance in direct lines from one central point.

In proof of the condition of some of the existing hospitals, a table of the mortality *per cent.* in the principal hospitals is given at starting, which shows that we have twenty-four London hospitals, affording a mortality of no less than 90·84 per cent., very nearly every bed yielding a death in the course of the year. Next, we have twelve hospitals in large provincial towns, Bristol, Birmingham, Liverpool, Manchester, &c., yielding a death-rate of 83·16 per cent. And there are twenty-five county hospitals in country towns, the mortality in which is no more than 39·41 per cent. "Here we have at once a hospital problem demanding solution. However the great differences in the death-rates may be explained, it cannot be denied that the most unhealthy hospitals are those situate within the vast circuit of the metropolis; that the next lower death-rate takes place in hospitals in densely populated large manufacturing and commercial towns; and that by far the most healthy hospitals are those of the smaller country towns."

The sanitary state of any hospital ought not, however, to be inferred solely from the greater or less mortality. If the function of a hospital were to kill the sick, statistical comparisons of this nature would be admissible. As, however, its proper function is to restore the sick to health as speedily as possible, the elements which really give information as to whether this is done or not, are those which show the proportion of sick restored to health, and the average time which has been required for this object. A hospital which restored all its sick to health after an average of six months' treatment, could not be considered as by any means so healthy as a hospital which returned all its sick recovered in as many weeks.

The master of some large works in London lately mentioned the following fact:—He was in the habit of sending those of his workmen who met with accidents to two different metropolitan hospitals. In one they recovered quickly; in the other they were frequently attacked with erysipelas, and some cases were fatal. On inquiry, it appeared that in the former hospital a larger amount of space was allowed than in the latter, which is also so deficient in external ventilation and in construction, that nothing but artificial ventilation could effectively change its atmosphere.

The want of fresh air, Miss Nightingale justly remarks, may be detected in the appearance of patients sooner than any other want. No care or luxury will compensate, indeed, for its absence. Unless the air *within* the ward can be kept as fresh as it is *without*, the patients had better be away. What must then be said when, as in some town situations, the air *without* is not fresh air at all? *No* artificial ventilation will suffice. Although in badly-constructed hospitals, or in countries where fuel is dear, and the winter very cold, artificial ventilation may be necessary, it never can compensate for the want of the open window. The ward is never fresh, and in the best hospitals at Paris, artificially ventilated, it will be found that, till the windows are opened, the air is close.

Natural ventilation is the only efficient means for procuring the life-spring of the sick,—fresh air; but to obtain this the ward should be at least from 15 to 16 feet high, and the distance between the opposite windows not more than 30 feet. The amount of fresh air required for ventilation has been hitherto very much underrated, because it has been assumed that the quantity of carbonic acid produced during respiration was the chief noxious gas to be carried off. The total amount of this gas produced by an adult in twenty-four hours is about 40,000 cubic inches, which in a barrack-room, say, containing sixteen men, would give 370 cubic feet *per diem*.

"Allowing eight hours for the night occupation of such a room, when the doors and windows may be supposed to be shut, the product of carbonic acid would be 123 cubic feet, or about 15½ cubic feet per hour. This large quantity, if not speedily carried away, would undoubtedly be injurious to health; but there are other gaseous poisons produced with the carbonic acid which have still greater power to injure. Every adult exhales by the lungs and skin forty-eight ounces, or three pints of water, in twenty-four hours. Sixteen men in a room would therefore exhale in eight hours sixteen pints of water, and 123 cubic feet of carbonic acid, into the atmosphere of the room. With the watery vapour there is also exhaled a large quantity of organic matter, ready to enter into the putrefactive condition. This is especially the case during the hours of sleep; and as it is a vital law that all excretions are injurious to health if re-introduced into the system, it is easy to understand how the breathing of damp foul air of this kind, and the consequent re-introduction of excrementitious matter into the blood through the function of respiration, will tend to produce disease."

If this be so for the well, how much more will it be so for the sick?—for the sick, the exhalations from whom are always highly morbid and dangerous, as they are one of nature's methods of eliminating noxious matter from the body, in order that it may recover health.

Second only to fresh air, we should be inclined to rank light in importance for the sick. Direct sunlight, not only daylight, is necessary for speedy recovery, except, perhaps, in certain ophthalmic, and a small number of other cases. Instances could be given, almost endless, where, in dark wards or in wards with a northern aspect, even when thoroughly warmed, or in wards with borrowed light, even when thoroughly ventilated, the sick could not by any means be made speedily to recover. Dark barrack-rooms, and barrack-rooms with northern aspects, will furnish a larger amount of sickness than light and sunny rooms.

Among kindred effects of light, Miss Nightingale mentions, from experience, as quite perceptible in promoting recovery, the being able to see out of a window, instead of looking against a dead wall; the bright colours of flowers, and the being able to read in bed by the light of a window close to the bed-head. It is generally said that the effect is upon the mind. Perhaps so; but it is no less so upon the body on that account.

All hospital buildings in this climate should be erected so that as great a surface as possible should receive direct sunlight.

The axis of a ward should be as nearly as possible north and south; the windows on both sides, so that the sun shall shine in (from the time he rises till the time he sets) at one side or the other. There should be a window to at least every two beds, as is the case now in our best hospitals. The window-space should be one-third of the wall-space. The windows should reach from within 2 or 3 feet of the floor to 1 foot of the ceiling. The escape of heat may be diminished by plate or double glass; but while we *can* generate warmth, we cannot generate daylight, or the purifying and curative effect of the sun's rays.

Let us look to Chapter III., and re-urge some of the principles of hospital construction. The first is to divide the sick among separate pavilions. The essential feature of the pavilion construction is that of breaking up hospitals of any size into a number of separate detached parts, having a common administration, but nothing else in common. And the object sought is, that the atmosphere of no one pavilion or ward should diffuse itself to any other pavilion or ward, but should escape into the open air as speedily as possible, while its place is supplied by the purest obtainable air from the outside.

The question of a general hospital plan resolves itself, first of all, into obtaining the most healthy structure of the pavilion; and second, into arranging all the pavilions in the way best suited to obtain free external ventilation, plenty of light on all sides, and convenient means of communication. To realize these advantages, pavilions may be placed side by side, or in line.

The distance between the blocks should not be less than double the height of the blocks. This rule is specially applicable to English climates, in which it is necessary to preserve as much space as possible for sunshine. A greater distance would be better; but this would involve a greater cost for land, and a greater distance to be traversed by the hospital staff.

There should not be more than two floors of wards to the block. The most healthy hospitals have been those on one floor only; and this because they require less scientific knowledge and practical care in ventilation. If another floor

* "Notes on Hospitals." By Florence Nightingale. Third edition, enlarged, and for the most part re-written. London: Longman, Green, & Co. 1863.

is added, a community of ventilation exists between the ward below and the ward above by the common staircase, and by filtration of air upwards through the floor. And hence there is a strong conviction in the minds of careful hospital physicians, surgeons, and nurses, that patients do not recover so well on upper floors. And there are instances in which the mortality of patients on upper floors has been higher than that of the floors below. Moreover, a *sick population* requires more surface for health than a healthy population. And it is clear that, if patients are placed on three floors instead of on two, the surface overcrowding is increased by one-third, unless the distance between the pavilions is increased in a corresponding ratio.

If the pavilions are single, *i. e.*, if each staircase give access to the end of the pavilion, as in the Lariboisière and Lisbon plans, there should be only one ward on each floor. The pavilion should never be divided so that a second ward or wards is placed beyond the first, to be reached by passing through the first. The reason is, that the floor, however divided by cross-walls, can never be other than a single ward. The cross-walls only obstruct the ventilation. If the doors are accidentally left open, the foul air in one ward passes into the next, and the greatest improvement in ventilation would be to pull down all the partitions and throw the pavilion open from end to end, so as to have only one ward on the floor. But then the ward would be too large.

If the pavilions are double, *i. e.*, if each staircase gives access to a ward right and left off the staircase, as in the Herbert Hospital, provided the staircase be of spacious size, and thoroughly ventilated sides and top, two wards may be placed on each floor with safety; and with this great advantage, that administration, nursing, and discipline are all facilitated, while expense in construction is saved.

Wards of a small size are decidedly objectionable, because unfavourable to discipline, inasmuch as a small number, when placed together in the same ward, more readily associate together for any breach of discipline than a larger number.

The best size of wards for insuring the two conditions of health and facility of administration and discipline, is that for from twenty to thirty-two sick. Wards smaller than of twenty beds multiply both the attendance, unnecessarily, and the corners, unfavourably for ventilation, in proportion to the number of patients. Wards larger than of thirty-two beds are undesirable, because they require a greater height of ceiling, and are hence more costly in construction and difficult to ventilate.

Cubical space obtained by great height of the wards will not compensate for want of area around the bed.

Let us inquire what is the smallest amount of superficial area we can do with. Hospital beds are generally from 3 feet to 3 feet 6 inches wide, and 6 feet 3 inches long, the bed space being increased to 7 feet by the bed being a little removed from the wall. The mere surface required to hold the bed is hence from 21 square feet to 24½ square feet. It is quite clear that, whatever surface area is required for ventilation, administration, or for clinical instruction, must be in excess of this amount. There should be space sufficient between the sides of adjacent beds to avoid stagnation of air altogether. There should also be room for free movement of three or four persons, for the use of a night-chair without annoying the next patient, and also for a portable bath, when required. The distance from foot to foot of opposite beds should be sufficient to afford space for a movable dresser or table, benches on either side, and easy passageway. In a well-constructed civil hospital in England, occupying a healthy, airy position, it cannot be said that 80 square feet *besides* the bed space, are too much. In round numbers, the superficial area per bed should be not less than 100 square feet.

Wards for the numbers of beds already given need not be higher than 15 feet, which would allow 1,500 cubic feet per bed.

If, however, a hospital is built in the centre of a large city, where pure air is not to be had, or in a locality where the circulation of air outside is deficient, it is hard to say what amount of space would make the building healthy.

"A good proportion for a ward of twenty patients would be 80 feet long, 35 (or 26) feet wide, and 16 (or 15) feet high. This would give 1,600 (or 1,560) cubic feet to each bed. It would give 11 (or 12) feet between foot and foot, which is not too much where there is a clinical school. It would give an average of 16 feet to each two beds in width.

Half the sick are supposed to be on each side the ward."

One window at least should be allotted for every two beds; the window to be not less than 4 feet 8 inches wide, the sill within 2 or 3 feet of the floor, so that the patient can see out, and it should go up to within 1 foot of the ceiling.

One of the most difficult points in ward construction is to find a good material for walls and ceilings. An impervious material capable of receiving a polish on a white or tinted surface would make the best lining for a hospital ward. What is wanted is such a surface as can be washed frequently with soap and water, without its being absorbed into the substance, and dried with towels, so as not to interfere with the current use of the ward. Parian cement is the nearest approach to a good material for this purpose hitherto discovered. But the polish is rather costly. And what is of more consequence, the manufacture has not yet reached such a point of perfection as to afford a surface of one uniform colour. Even the best becomes blotchy after a short time, and is liable to crack, especially when applied to ceilings. If manufacturers wish to bring this substance into general use for hospitals, they must improve the material until the cement can be applied over any required extent of wall, and retain a uniform texture, colour, and polish.

The materials used for floors may be oak wood, pine wood, or tiles. Oak wood, well seasoned, is the best. No sawdust or other organic matter capable of rotting should be placed underneath the floor. Concrete, or some similar indestructible substance, would be the best for the purpose.

A hospital floor should never be scoured. A very good hospital floor is that used at Berlin, which is oiled, lackered, and polished so as to resemble French polish. It is wet-rubbed and dry-rubbed every morning, which removes the dust. Its only objection is want of durability. The joints of the flooring must be fitted well together, and cemented with any impervious substance.

Looking again to plan, it is a fundamental principle that the pavilions, whether single or double, should contain nothing but the sick and the offices immediately required for the ward. Everything else, board-rooms, chapels, quarters for officers and servants, except for the head nurse or nurses of each ward, stores, kitchens, laundries, should be placed in a separate building or buildings. It would be better, even, that convalescent rooms, where it is determined that there should be such rooms, should be out of the main building, but accessible under cover; for the obvious reason that convalescents require change of air which cannot be obtained under any circumstances in a hospital. The matron should always have her rooms as near to the nursing staff as possible. And it is highly desirable that the day and night nurses of each ward should be kept as a separate staff, lodged as near to the head nurse as possible; if room can be found for these near their own pavilion, it is better.

Simplicity of construction, involving, as it should always do, a provision of abundant light and ventilation through every part of the hospital in which sick are placed, can only be secured in hospitals of any size by separating the administrative part from the sick part. The smallest country hospital should consist of at least two blocks of building.

We may not now continue farther our notice of Miss Nightingale's admirable book. Suffice it to say, in conclusion, that all who are concerned, or are likely to be concerned, in the erection of hospitals, or in their management when erected, should obtain and master this new edition of the "Notes." A right direction has been given to the planning and the construction of new buildings for the sick and wounded. What is now specially needed is, that the governors and directors of existing institutions of the kind should be led to take steps for their speedy re-arrangement, if not re-erection; so that the great and unnecessary waste of life that stil takes place in them may forthwith be lessened.

PROFESSOR SMIRKE ON ARCHITECTURE AS A FINE ART.*

OTHER more suitable occasions may present themselves for a detailed comparison of the two styles referred to in the previous portion; but there is one point of distinction so broad, and so unquestionable, that I cannot refrain from here adverting to it,—I mean the subordination of horizontal lines to vertical lines in Pointed architecture, and of vertical to horizontal lines in Classic architecture. If we regard the latter in its whole range, from the primæval efforts of Egypt down to the latest vagaries of the Borromini school, we find horizontal lines always *dominant:* the entablature in some shape is scarcely ever wanting; cornice, coping, balustrade, string-courses, all have a horizontal tendency; and when vertical lines *are* resorted to, there appears to be a perpetual eagerness, as it were, to interrupt their continuity. Whilst, when we turn to Mediæval architecture, from its earliest distinct development to its final extinction, a never-failing tendency to vertical lines and upward extension is manifest. When a constructive necessity occurs for a horizontal feature, it is kept insignificant by faint projection and frequent interruption,—*height*, in fact, appears to have been the *dominant thought* of all Mediæval architects.

This striking and fundamental distinction is the chief cause of that impassable line of separation which now exists between these two great systems of design, each so beautiful, yet so different.

I should be ill expressing my own feelings if I were not to urge on you a close, diligent study of both these styles: for both are alike deserving of our attention. The younger style we may pronounce, as compared with the elder, perhaps, more free and picturesque; more plastic and manageable; more varied and copious in its details; more intimately associated with our history; and in ecclesiastical structures the habits of four or five centuries have interwoven it with our religious feelings. On the other hand, the elder style we may regard as more symmetrical, more grand and severe, more refined and polished, whilst in some of its later phases it is more applicable to festive and cheerful purposes.

The great aim and object of all style, as such, is to produce certain forcible impressions on the mind, which impressions are usually classed under the two leading heads of the *sublime* and the *beautiful*. I shall *not* launch out into any metaphysical inquiry on the nature and sources of these two wide topics. The field of inquiry has been so often and so ably trodden, that it would be difficult to gather any new flowers in such a search. The subject has been amply discussed; from Longinus down to Alison, the sublime and beautiful have been favourite topics with the highest intellects and the profoundest thinkers.

To such sources then (if you should have the curiosity to pursue an inquiry from which I cannot promise you very much fruit) I would refer you for the study of the two great instruments by which our art is supposed to acquire its power to affect the spectator's mind.

I hope, however, it may not be held pre-

* See p. 28, *ante*.

sumptuous in me to say that amidst the profusion of written learning lavished on these topics, not a few fallacies may occasionally be encountered; you must, therefore, read with thought and attention, remembering that what is *well* said, is not always *truly* said. Thus, Alison, too eager to prove his favourite dogma, that there is no such thing as inherent beauty in any object, will advance opinions to which all the refinement of his polished pen will scarcely avail to command our assent. He states, for example, that "what we call beauty in colour is not due to any original or independent beauty in the colours themselves, but to associations we connect with them."

He tells us, too, that "no forms or species of forms are of themselves originally beautiful; but that their beauty, in *all* cases, arises from their being expressive to us of some pleasing or affecting qualities." Against this theory we have but to set up the very opposite theory of another writer, that great and original genius, Hogarth, whose whole book is devoted to prove the inherent beauty of one particular line—the *one*, curvilinear, *line of beauty!* As if the sources of beauty were not endless! As if a *line* had an intrinsic beauty independent of the use to which it was applied, or the nature of the object of which it forms the external boundary!

With no greater violation of truth we might attempt to define *the hue* of beauty in painting, or *the note* of beauty in music. Again, it is a prevalent and plausible theory that the true beauty of an object consists solely in its fitness for the purposes for which it is destined. I readily admit that *unfitness* for its purpose is a fundamental defect to which nothing ever can or ought to reconcile us. But to urge that utility is *all* that is required to impress us with a sense of beauty would surely be going too far. In nature, the mother and mistress of all arts, there are many illustrations to which I might appeal. The *legs* of a peacock, for instance, are surely more directly useful than its *tail;* but how unseemly are they, when compared with that gorgeous appendage. No doubt, there is great beauty in the fitness of the leg for its purpose; but there is a beauty in its *plumage*—of another kind, it is true—yet I conceive even more effective in producing lively pleasure in those who contemplate it. The beauty of the leg speaks rather to our reason than to our feelings, whilst that of its plumage needs no exercise of reason to command our admiration. It is that *latter* kind of beauty which the Germans, borrowing from Greek sources, have taught us to call *æsthetic*, and which, I think, needs your chief study, for it is a kind of beauty far more difficult to understand, or define, or hold in our intellectual grasp. The beauty of *fitness* may be measured and weighed by the easy standard of common sense; the other, more subtle, more immaterial, may be perceived and yet not measured or even explained. Like a wreath of mist, the rainbow, the mirage, or the northern aurora, it is a reality; it is there, before us, in a thousand forms of loveliness; yet the vision eludes that closer scrutiny we desire, and refuses to submit to the test of a stricter investigation.

Unfortunately for the teacher of art, it is far more easy to say what is beautiful, than to say wherein that beauty consists.

A sense of what is beautiful in the *physical* world operates like the conscience in the *moral* world; which impels or deters, often, without the intervention of reason. We often, perhaps indeed *usually*, perceive what is morally right or wrong at once and without any process of examination. So the recognition of beauty is an intuitive result, at which we ought to be able to arrive before we have formed any definitive idea of the cause, or have sought to investigate the motives upon which our judgment is founded.

A true student, however, will not rest satisfied with this vague impression, but will endeavour to search out its causes; and whatever may have been the errors into which men of genius may have been misled by their confident reliance on some favourite theory, the student should be thankful for the hints which philosophic inquirers have afforded to aid him in his search.

It is, of course, an essential part of the task of a lecturer on our art to bring before your notice examples of the highest qualities of the art, practically presented to us in the master-pieces which time has spared. Our art may boast a proud pre-eminence among the sister arts, in its *capacity* to present such examples. In addition to the durability of its monuments, it has been truly said of Architecture that she alone is able to excite emotions similar to those excited by the contemplation of the great works of nature. If such be true, it is indeed a very noble incentive to genius that it should be permitted to the architect so to distribute and deal with mere inert matter,—with fragments of rock or pieces of burnt clay,—and so to pile them up as to make them the source of a high intellectual pleasure, and even to strike us with awe and astonishment.

Besides the two primary qualities of sublimity and beauty, a claim has been set up for a third attribute, or quality, as worthy to be classed with them, and as forming one of the great aims of art; though I am by no means satisfied of its claim to be treated on a footing of equality with them. I allude to the *Picturesque*,—a word of modern Italian origin, designating that which is well suited for the painter's art. I believe it was Uvedale Price who first attempted to define distinctly the attributes of the Picturesque, and claim for it an independent position.

Picturesqueness seems to be a term, in our art at least, more applicable to a combination of forms than to any one form. A single object, as a cornice or a column, may be said to be beautiful, or even sublime, but it can hardly be said to be *picturesque*. There must, I think, be *variety* of lines, or of tints, or of chiaroscuro, in order to constitute the true picturesque. One of the most eminently picturesque single objects I know is the Pharos at Genoa; but even here the structure itself can scarcely be so designated. It is its *position*, its *substructure*, and its *accessories* which impress it with that peculiar character.

It is this dependence of the picturesque on a happy combination, or grouping, of forms, rather than on the artful design of any one form, which renders it a dangerous object of pursuit with the architect. It can rarely be the result of premeditation; it should come unbidden. Certainly the happiest and most charming instances of this quality of art have been the result of accident. Perhaps the castles of the Middle Ages, especially those of the thirteenth and fourteenth centuries, abound more than any other class of buildings in the ingredients of the picturesque. Which of us, for example, could ascend the long flight of steps leading to the higher and inner gateway of the great castellated monastery of St. Michel, near Avranches, without fancying that some sublime genius, pregnant with all the poetry of architecture, had designed that gate and moulded its scenic turrets with no other object than to fill the spectator with awe? Yet we may be sure that nothing could have been more remote from the mind of those builders than to *make a picture*. The barbican, the keep, the menacing machicolation, the deeply-recessed archway, the varied outline, the broad chiaroscuro, are all features happily incidental to the military wants and exigencies of those times; and yet, who is so utterly and almost necessarily regardless of the picturesque as the engineer?

Even in Domestic architecture, if we examine any highly picturesque building,—Haddon Hall, for example,—we shall not fail to find that the agreeable effects in which it abounds are by no means the offspring of studied irregularity, or of any *finesse* of art. The embayed window is thrown out just where the *view* invites one; the fireplace projects in bold relief, and its smoke tunnel is carried quaintly off to one side, simply because the ease and comfort of the occupant required that those objects should be placed in those situations. The result *happens* to be highly picturesque, but it is so, as it were, by accident. There is no reason whatever to doubt the ability of the old builders fully to appreciate the effect of all their arrangements, but there was no *straining after that effect*. A bold, almost careless freedom of design, characterized all their work. I need scarcely repeat that a laboured imitation of these happy accidents is sure to lead to failure and disappointment; sometimes, indeed, to the ridiculous.

I do *not* counsel the young practitioner to disregard those superficial arts of design which please the eye; but it should be his chief aim and first consideration so to do his work that each part should answer its purpose thoroughly well; and it is very doubtful whether he can adopt any process better calculated to secure a pleasing result.

Before quitting these general views, I think it incumbent on me to advert to one of the dogmas of our art, the soundness of which is undeniable, but which is attended with some difficulties.

Painting and Sculpture are so fortunate as to have in *nature* a standard of excellence for ever before them, a frequent recurrence to which keeps them on their true course.

But Architecture is less able to draw her inspirations from that pure source: her wants are too artificial; she is too dependent on the requirements of man to enable her to look implicitly up to nature.

But Architecture, still, has a ruling principle, which is *Truth*. From Vitruvius downwards this has ever been taught, although in practice it has often been grievously disregarded.

There is an honest simplicity—a plain manliness—about *truth* which wins our regard, whether in ethics or æsthetics. But whilst we recognize truthfulness as a cardinal virtue in our art, as well as in morals, we must take care not to allow that analogy to carry us too far.

We often meet in the practice of out art with necessities utterly inconsistent with beauty. Hard lines, unsightly angles, heavy, graceless forms, imposed on us by structural requirements; it would be a mischievous error to suppose that, because in our social conduct there should be no deception nor concealment whatever, we are therefore bound to expose to view these mechanical deformities from which we cannot escape; whilst, to depart from the form that is mechanically the *right* form, only to make it more agreeable to the eye, would be a still graver error. That there should be a politic concealment sometimes studiously resorted to, some ingenious art practised occasionally,—such, for example, as the concealed buttresses and the hidden ties and props common in our old buildings,—seems therefore to be an unavoidable condition of our calling. In the most naturalesque schools, nature is not, and never has been, copied with a stern adherence to exact truth. The simplest leaf requires *treatment* to fit it for the purpose of decoration, and treatment implies some modification or humouring of form or of colour; in short, *some* departure from nature, and consequently from truth. Nearly allied to this is another principle of our art, which, although by no means universally acted upon, yet justly claims our most respectful submission. We should have a care how we introduce into our design anything which does not serve *some* good *purpose*. I do not mean that mere *utility* would justify a *deformity*, nor do I mean that every architectural feature in our design should be a structural necessity; but that, although it may not be to add strength or to afford support, it should at least have its appropriate *purpose;* a valid reason should be assignable for it; some good end must be sought to be attained by it; some offensive angle or feature to be removed; some unsightly blank to be relieved; some monotony of line to be broken; some needed light or shadow to be introduced; some discord in form or colour to be allayed.

Doubtless it is a maxim worthy of all acceptation that utility is one of the most important elements of beauty; yet those who recognize architecture as a *fine* art will admit that simple, bare utility is not the sole aim of our art. This qualification of the really valuable and important principle of usefulness will, I fear, scarcely meet with *general* sympathy: the utilitarian current sets in so strongly in some minds that it well nigh carries all other considerations before it. It is enough to say that neither painting nor poetry, nor music, nor letters, nor any of the arts which embellish life, can lean for support on that class of intellect which refuses to assign to them a footing within the domain of social usefulness.

With all respect for so inestimable a guide in the common business of life as *utility*, I will venture to encourage you by pointing out to you the prodigal munificence which has arrayed the lily of the field, which neither toils nor spins, in a raiment of surpassing glory; which has given to the birds of the air not merely their needful feathers but a plumage of infinite beauty; has lavished on the shell-fish of the deep seas tints which no art can reproduce; and the *pearl*, which princes are proud to wear. Nay, *Virtue* itself has found a fit companion in the *beauty of the human form*.

"Gratior pulchro veniens in corpore Virtus."

Why, then, should Architecture be forbidden to indulge, moderately and wisely, in some *graceful inutilities?*

It is the fear of excess and abuse that alone renders this indulgence dangerous; and to arm the student against such danger is one of the foremost duties of the art-teacher.

Truthfulness and usefulness must indeed be taken as our guides in the highway along which we may travel unwarily and without danger. It is when we diverge into the by-paths and inviting lanes of mere æstheticism that we most need to be on our guard against failure.

I have now detained you quite long enough on these general views. Our art is a peculiarly practical one, and needs to be dealt with in details rather than in generalities. I shall, therefore, now close my present discourse, by addressing to the architectural student a few parting words.

You are set out on a pilgrimage which will need much preparation, and a large fund of enthusiasm to cheer you on your way. Set out on it with a conviction that an abundant store of knowledge is the best provision you can make for the journey.

Besides obtaining a thorough mastery over your own art, cultivate an acquaintance with the sister arts. It will be wholesome to bear in your memory the very intimate relation which subsists between *all* the departments of high art, which find their home within these walls. Together they will ever flourish or decay: each needs the aid of the other. It is for Architecture to build the sanctuary; it is for Painting and sculpture to spread out their treasures for its perfection. It is for *them* to give life to its inanimate walls, by peopling them with the story of past times, by refreshing us with the charms of natural scenery, and by making them the depositories of those memorials which link the living with the dead.

Above all things, in your pilgrimage, be especially anxious to dismiss and discard for ever from your minds all petty feelings of personal jealousy.

Pull at no man's skirt: outrun him, if you can, in the race of honourable rivalry; but depend upon it your progress will be impeded—not promoted, by the indulgence of professional jealousy or censorious criticism.

Let not your spirit be weighed down, nor your course turned aside, by any such sinister, unworthy objects. The rivalry in *labour* is the best, and only useful rivalry. You will find the buoyancy of self-reliance wonderfully assisted by that lightness of heart and cheerfulness of spirit which never fail to accompany an habitual goodwill towards others.*

THE LATE MR. JOSEPH WOODS, ARCHITECT.

THE death of Mr. Woods, to which we referred in our last, took place when he was seated in the easy chair of his study: he died, as he had lived, calmly. This estimable gentleman was born at Stoke Newington, on the 24th of August, 1776, and was the second son of Mr. Joseph Woods and Margaret his wife, daughter of Mr. Samuel Hoare, whose son Samuel became the senior partner in the banking-house of Hoare, Barnett, & Co., Lombard-street. His father, although engaged in commercial pursuits, was a gentleman of high attainments, and a frequent contributor to the pages of various literary publications, both in Latin and English prose and verse. In the days of Mr. Joseph Woods's childhood, to use his own words, "there was a great deficiency of good schools among the Society of Friends, to which my parents belonged, and one year passed in attendance on a day-school in London, kept by a Mr. Lord, was the only efficient schooling I had." He was, therefore, in great measure a self-educated man. He entered upon a business life as a pupil of Mr. Alexander, a well-known architect of that day. About three years after he commenced the practice of this profession on his own account. He was one of the first institutors, if not the first president, of the London Architectural Society, founded in 1806, and contributed valuable papers and essays on kindred subjects, to the meetings of this Society, concerning which we gave some information not long ago. His health proving insufficient for the drudgery of his profession, and being possessed of means, which enabled him to act independently, he indulged his artistic taste and talent by a residence of some years abroad. Of this period it was said in our pages by Professor Donaldson, "It is charming to see my old friend Joseph Woods, seated in his study finishing up some of his Grecian studies made above forty years ago, and discoursing of arts and artists with grace and vivacity, and of reminiscences when we were together at Rome, and were meeting Canova, Camucini, Thorwaldsen, and like men of mark there, with John Soane, jun., Basevi, Bond, Saunders, George Rennie the sculptor, and other such, now passed away. Hardwick and myself used to go to his rooms, and we read Goldoni and Alfieri together, and battled it out on many questions of taste regarding Greek and Roman architecture."

The results of his foreign labours were given to the public in a book well known as "Letters of an Architect from France, Italy, and Greece," 2 vols. 4to. 1828, as well as in the editorship of the third volume of Stuart's Athens.

Mr. Woods was himself an artist of no mean pretensions, more to be valued as a faithful and accurate delineator than as exhibiting an imaginative mind. His style of colouring may be considered generally as too cold, but he was occasionally warmed up by his subject, and especially so in later years. It has been one of his amusements to finish off, and present to his friends his sketches of olden date.

Mr. Woods was an old member of the Geological, Antiquarian, and Linnæan Societies, and was best known, perhaps, to the members of the last-named society as a botanist of high European reputation. His tenacious memory, persevering habits, and fondness for country rambles, qualified him for his favourite pursuit botany. His scattered contributions and numerous discoveries in this branch of science are of high value. His "Tourist's Flora," published in 1850, has proved an almost indispensable companion to every botanist, and his name will be perpetuated to posterity by the very rare and beautiful little ferns *Woodsia hyperborea* and *ilvensis*, a very distinct genus named by Mr. Robert Brown, many years president of the Linnæan Society, London. Mr. Woods, up to the day of his decease, was steadily engaged in the preparation of a second and enlarged edition of this work.

Although during his long life a bachelor, his domestic qualities were highly appreciated by both old and young, who had the privilege of his intimacy. Possessed of a sound judgment and a large stock of common sense, he was a constant friend and valuable adviser, but his character, partly no doubt from his feeble state of health, was too unobtrusive and retiring to bring him into that contact with the literary and scientific world to which his talents entitled him. On several occasions he gave our pages the benefit of his varied knowledge. They who knew him best loved him most.

THE LATE MR. CHARLES M'INTOSH, LANDSCAPE GARDENER.

MR. CHARLES M'INTOSH, whose death we mentioned last week, was born at Abercairney, in Perthshire, where his father was gardener to Mr. Moray. He was educated at Maderty, at the school conducted by Dr. Malcolm. He preferred gardening to theology; and after some time spent in the garden at Abercairney with his father, left for a position in the gardens at Taymouth Castle, the seat of the Marquis of Breadalbane. While still a young man he went to seek his fortune in the south; and spent some time in Hampshire, London, and elsewhere, making fast and influential friends wherever he went. It was to Mr. M'Intosh, acting under the directions of Mr. Horner, that the Londoners are indebted for the gardens of the Colosseum. The intelligence and taste of Mr. M'Intosh recommended him to the notice of the King of the Belgians, who was at that time resident at Claremont, and by his majesty he was appointed curator of the Royal Gardens there, and afterwards of those at Brussels. Her Majesty the Queen permitted him to dedicate to her his work, "The Book of the Garden."

In 1838, Mr. M'Intosh returned to Scotland to take the management of the Duke of Buccleuch's gardens at Dalkeith. After a period of nearly twenty years spent as head gardener to the duke, Mr. M'Intosh resigned his appointment to become a landscape gardener or garden architect on his own account; since which time he has been engaged in beautifying the residences of many citizens, and the gardens and parks of many of the gentry and nobility of the country.

Besides his "Book of the Garden," Mr. M'Intosh at an earlier period of life wrote the "Practical Gardener," published in two volumes, and of which he saw three editions through the press before he sold the copyright; "The Greenhouse," "The Orchard," "Flora and Pomona," "The Year Book," in connexion with Dr. Lindley Kemp, and "The Disease of the Larch." He was a frequent contributor to many gardening periodicals besides; and in particular to the *Gardeners' Magazine* and *Paxton's Magazine of Botany*. He was also, along with Dr. Lindley, one of the founders of the *Gardeners' Chronicle*. Many friends deplore his loss.

THE LATE MR. CASEBOURNE, C.E.

MR. THOMAS CASEBOURNE, whose death occurred on the 2nd inst., was a native of Hemel Hempstead, Herts, and was born in 1797. In early life he devoted himself to engineering pursuits, and was a favourite pupil of Telford, the designer of the Menai Suspension Bridge and the Caledonian Canal. Mr. Casebourne was one of the oldest surviving members of the Institution of Civil Engineers, having been admitted an Associate in 1828, and a full member in 1837. He was privileged to assist Mr. Telford in several of his works, and subsequently, amongst other duties, he was engaged in the Lincolnshire Fens Drainage, the London and Liverpool Road, the Metropolitan Water Survey, &c. From 1833, and for twelve years subsequently, Mr. C. was engaged on canal works in Ireland, and the extensive canal connecting Lough Neagh and Lough Erne was constructed under his superintendence. In 1845 Mr. Casebourne removed to the locality now so well known as West Hartlepool—then a mere hamlet—to undertake the Resident Engineership of the West Hartlepool Harbour and Docks; and since that period his name has been intimately connected with all that related to the port, harbour, and town of West Hartlepool. On the incorporation of the Commissioners in 1854, Mr. C. was one of the original commissioners appointed by the Town Improvement Act; and continued to fill the office of commissioner up to his decease. He was for some time chairman of the Board, only resigning that appointment in favour of Mr. R. W. Jackson a week or two before his death. He for a short time represented the West Hartlepool town interest in the Pier and Port Commission; but on the resuscitation of the Refuge Harbour question, retired from that office, so that he might not be said to sit in judgment upon his own amongst other competing plans.

At the West Hartlepool Improvement Board, Mr. Casebourne was a regular attendant. He was also for many years a vice-president and life member of the local Literary and Mechanics' Institute.

ON THE INJURIOUS EFFECTS OF SMOKE ON CERTAIN BUILDING STONES.*

EVERY addition to our knowledge of the causes of decay in stones has a tendency to bring within easier reach the appropriate remedy. At all events, a more comprehensive knowledge of the causes of decay in stones will help us to discriminate with more certainty between good and bad stones, and to avoid the employment of building materials which, although they stand the influence of the weather very well in the open country, or in exposed situations, are nevertheless unfit for particular parts of a building, and cannot be used with safety in some localities. Having been engaged for some time past in examining the characteristic black crusts which are frequently seen on buildings erected of Bath and similar oolitic limestones, my attention was specially directed to the study of the nature of the decay which attacks with great energy some kinds of calcareous stones, and I have come to the conclusion that the injury which the smoke of towns exerts on Bath stone, magnesian limestone, and other calcareous building stones, is far more pernicious in its results than it is generally believed to be. It will, therefore, devolve upon me to direct your attention particularly to the changes which such stones undergo under the influence of a smoky atmosphere, such as we find in most towns.

In common-day life we usually understand by smoke, the black and more or less tangible impure air which rises from the chimneys of fireplaces and furnaces in which the combustion of the fuel is imperfect, in consequence of which some finely-divided carbon and a variety of gases are thrown into the air.

* From a paper read at the Society of Arts, by Dr. Augustus Voelcker, on Wednesday evening last.

* The second and third lectures delivered by the Professor were reported in our pages on a previous occasion, so that it is not necessary now to give them.

That this black smoke exerts an injurious effect on building stones and on vegetation, is admitted in a general way, but I have no hesitation in saying that the extent of the injury done by the smoke that at times obscures the sky in our crowded cities has not been fully recognized. This, perhaps, is the reason why the precise chemical changes which are produced by accumulations of soot on limestones and calcareous sandstones have not been studied with the minuteness which the importance of the subject evidently requires.

Before giving an account of my analytical experiments on the effect of smoke on oolitic limestones, a few general observations on the nature of the decay in stones may not be out of place.

Building stones in general may be divided into two classes:—

1. Stones which, like granite, porphyries, and most sandstones, are not easily acted upon by acids.

2. Stones which, like limestones, dolomites, and some kinds of calcareous sandstones, are composed of materials that are partially or entirely attacked by acids with facility.

Building stones belonging to the second class are much more liable to suffer injury by atmospheric agencies than those belonging to the first class; and as, moreover, limestones and dolomites are principally employed for ornamental buildings, the investigation of the causes which lead to their decay possesses a special interest.

The conditions under which calcareous stones decay when placed in a building, are partially mechanical and partially chemical. The absorption of moisture by porous stones, and the disintegration to which it leads in consequence of the resistless expanding force of water in becoming ice in cold weather, are illustrations of a purely mechanical cause and effect, which frequently manifest themselves in limestones used for building purposes. The changes produced on building stones by carbonic acid and the sulphur compounds in the air of towns, are instances of chemical reactions, which may be seen in their results in some cases as distinctly as the results of purely mechanical force, to which allusion has just been made. Building stones of a loose or irregular structural composition are of course more liable to suffer injury from the absorption of moisture than hard, compact, and crystalline stones of the same or similar composition. The more readily a specimen of Bath or Caen stone is affected by mechanical agencies the more easily it will be found to be acted upon by chemical reagents.

The action of oxygen is of comparatively a subordinate character, its effects confined to constituents which are usually absent or occur only exceptionally, and then in but small quantities of limestones and dolomites. In calcareous sandstones, sulphides of iron and protoxides of iron and manganese occasionally are found, and as these compounds are very prone to absorb oxygen, and the higher oxides thus formed are more voluminous than the original protoxides, such stones are subject to the disintegrating action of atmospheric oxygen. Of far greater importance are the effects of moisture. Water, either in the shape of vapour or liquid, perhaps is the most powerful agent of destruction that displays itself in the gradual crumbling down of calcareous stones. Porous and soft stones of that kind should never be employed for parapets, window-sills, weather-beds of cornices, strings, plinths, or other parts of a building where water may lodge. The changes which water produces in porous stones exposed to drip and alternations of a wet and dry condition, appear to be less of a chemical than a mechanical character.

The expansion which water experiences on sudden alterations in the surrounding atmosphere, and the irresistible force which it then exerts, necessarily exercise a disintegrating action. If the temperature sinks below the freezing-point, this destructive action is most powerful, since water in becoming ice suddenly and greatly expands. But even above the freezing-point, the expansion of water at a sudden elevation of temperature appears to me to exert upon porous building materials a mechanical force sufficiently powerful to account for their gradual decay at seasons of the year when it cannot be referred to the formation of ice within the pores of the stone. There can be no doubt that all stones which possess in a high degree the property of absorbing moisture, are unfit for building purposes. Certain kinds of porous limestones and sandstones, differing widely in composition and in relation to their liability to become attacked by acids, are alike subject to this disintegrating action, thus indicating plainly that their decay is not the result of the chemical action of an atmospheric constituent, but the result of the mechanical action which water exerts on all porous and absorbent materials, no matter what their composition is.

Such stones, it will be readily conceived, must be very liable to crumble down in our moist and changeable climate. In towns, and in the country in sheltered or in exposed parts, on the outside or the inside of buildings, and in short under the most varied conditions, the decay will proceed steadily when it has once begun to show itself in porous and absorbent stones. The fact that these building stones, which decay as readily in open country places as in towns, has led some men to entertain the opinion that the impurities present in the air of towns and in the immediate neighbourhood of manufacturing districts, have nothing to do with the gradual disintegration to which oolitic and other calcareous building stones are subject. But although it is quite true that some building stones do not require to be exposed to the injurious effects of the atmospheric impurities of crowded cities in order to decay, it is no less certain that there are others which stand wind and weather well in the country, but are more or less readily attacked by atmospheric influences when employed in the erection of town residences.

The fact is, the structural composition of some stones is so irregular, and radically bad, and their absorbent powers for moisture so great, that they are alike unfit for the erection of buildings in town or country, whilst there are others possessing sufficiently good physical characters to resist the mechanical effects of water, to which reference has been made, and remain sound in a comparatively speaking pure air, but which are not of such a chemical composition as to be capable of withstanding the pernicious chemical influence of a less pure town atmosphere.

Carbonic acid is a never-failing constituent of the air, and is consequently present also in rain-water. Much stress has been laid on the dissolving action of rain-water on limestones; but it appears to me this action has been greatly overrated. Instead of practical proofs, showing that water charged with carbonic acid really exerts a powerful disintegrating influence upon calcareous stones, merely theoretical reasonings have been advanced in support of that opinion.

It is true, water charged with carbonic acid in contact with carbonate of lime or magnesia gives rise to soluble bicarbonates; but even were the quantity of bicarbonate of lime or magnesia much greater than it actually is, the mere removal of a trifling portion of lime from the surface of the stone does not, I take it, explain the peculiar exfoliation and corroded appearance which many oolitic building stones present to our view. Calcareous stones, exposed to long-continued dissolving action of water containing carbonic acid, exhibit rather a smooth and water-worn but not a corroded appearance.

In the next place we have to consider the effects likely to be produced by the small quantities of nitric acid which are invariably present in the atmosphere. The proportion of nitric acid in the air is so minute that it may be questioned whether these minute traces have any marked influence on our buildings. With respect to the supposed corrosive action of nitric acid of the air, and the formation of nitrates in limestones, I made some experiments, a brief account of which may here find a place. A few years ago my attention was directed to the decay of the oolite limestone of which the lodge at one of the entrances at Badmington is built. This stone was quarried at a place about two miles from Badmington, and, like Bath stone, is not very hard. The stone protected by the porch of the lodge I found in a more advanced state of decay than that freely exposed to wind and weather.

* * * *

In the next place the foreign or accidental impurities of the air of towns will have to be considered.

The quantity of sulphur-acids in the air of towns is quite appreciable. The quantity of coals consumed in London for domestic and manufacturing purposes exceeds three million tons per annum, and as all coals contain sulphur, the greater portion of which is discharged during their combustion as sulphurous and other sulphur-acids, an enormous quantity of these destructive acids must find their way into the air. No numerical data exist with regard to the proportion of sulphur-acids in the London atmosphere, but, according to Dr. Angus Smith, the air of Manchester contains an average proportion corresponding to one part of sulphuric acid in every 100,000 parts of air, which in the centre of the town, rises to 25 parts in 100,000. According to the quality of the coal and the amount consumed in a given space in a given locality, the proportion of sulphur-acids in the air of towns will vary. In some places it may, no doubt, be greater, in others less than in the air of Manchester; but under all circumstances it will be sufficiently large to cause serious apprehensions.

The strong affinity of sulphuric acid for lime and magnesia renders it a destructive agent for calcareous building stones. Sulphuric acid not only renders soluble these earthy carbonates, but, forming with lime gypsum, a compound which contains in round numbers 20 per cent. of water of crystallization, and with magnesia the well-known sulphate of magnesia, a salt remarkable for the large proportion of water of crystallization which it fixes, it gives rise to a mechanical destruction of Bath stone and magnesian limestones similar in every respect to that produced by freezing water. The efflorescences of sulphate of magnesia which have been noticed upon those portions of magnesian limestones where exfoliation has taken place, afford a practical proof of the destructive action of the sulphuric acid that occurs in the air of towns. Hydrochloric acid occasionally has been found in the air of towns. It is, however, not a usual impurity; and as on the 1st of January the Act passed in the late session for the more effectual condensation of muriatic acid gas in chemical works has come into actual operation, and there is no practical difficulty in securing the condensation of this gas, no fear need be entertained that the buildings in towns will be affected by hydrochloric acid fumes.

Still more pernicious in its influence than the free sulphur-acids which exist in the air of towns, I have reason to believe, is the black smoke which deposits soot, to the great disfigurement of our public and private buildings. The soot deposit is particularly destructive to the carved portions of buildings. In order to render intelligible the peculiar chemical action which smoke exerts on calcareous building stones, I beg to invite attention to the following analysis of a sample of ordinary house-coal soot, which I made many years ago. In 100 parts of soot I found:—

Moisture	10·620
Organic matter (chiefly black carbon)	44·736
Chloride of ammonium	·933
Sulphate of ammonia	3·880
Chloride of sodium	·231
Chloride of potassium	·503
Oxides of iron and alumina	15·091
Sulphate of lime	11·051
Phosphate of lime	·530
Carbonate of lime	1·129
Lime in a state of silicate	2·290
Magnesia in a state of silicate	·389
Soluble silica	1·014
Insoluble siliceous matters	4·139
	99·856

The proportion of sulphate of ammonia in different samples of soot, I find, varies exceedingly. In some samples I have found as much as ten, twelve, and even more of sulphate of ammonia. Perhaps 5 or 6 per cent. represents better the average quantity of ammonia than the figures in the above analysis. Soot is essentially a mechanical mixture of finely-divided carbon with sulphate of ammonia, some sal-ammonia, and the fine particles of coal-ashes. An inspection of our public buildings shows that it is carried about in the air, and deposited in considerable quantities on buildings, more particularly on the more sheltered parts. Soot, it need hardly be remarked, is a constituent of the smoky atmosphere of towns, and is calculated to do great injury to the ornamental work of buildings executed in Bath stone or magnesian limestone. The most destructive agent of such a smoky atmosphere, as far as calcareous building stones are concerned, I am inclined to think is the sulphate of ammonia, which, as has been shown, is a constant constituent of soot. This conclusion has been forced upon me by the examination of the sooty deposit which was found on a magnificent church in a large commercial and manufacturing town. This church is built of an oolite limestone found in the neighbourhood, and, on account of the increasing decay, which has quite disfigured the structure, and in many places effaced the finer delineations of the carved work, is now under the process of restoration. On some of the older parts of the church the sooty deposits have penetrated the stone to a considerable depth. The stone here appears to be covered with black crusts, varying from half an inch to more than an inch and a half

in depth. These crusts crumble off spontaneously from time to time, or can be easily removed by the application of a slight pressure. I made them the subject of a rigorous analysis, with a view of ascertaining the changes the original building stone evidently had undergone under the influence of a smoky atmosphere, and I was perfectly amazed to find how radically the original composition of the stone had become changed, and was left in no doubt as to the origin of the black crusts.

The stone of which this church is built is a good oolitic limestone, which is composed chiefly of carbonate of lime, with no more sulphate of lime, magnesia, oxide of iron, and insoluble siliceous matters than generally occur in the latter description of oolitic limestones. The following analysis refers to the composition of the uncorroded limestone :—

Water driven off at 212 degrees	·230
Water of combination	·110
Carbonate of lime	97·690
Sulphate of lime	·153
Magnesia	·370
Protoxide of iron	·540
Alumina	·120
Soda	·044
Potash	·296
Insoluble siliceous matter (silica).	1·350
	101·003

In the course of years this stone becomes covered, as has been already stated, with a dark-coloured incrustation, which increases in depth with the time during which buildings are subject to the corroding influence of a smoky atmosphere. The analysis of some of these black crusts has shown me that as much as two-thirds are soluble in water and only one-third insoluble. Dried at 212 degrees, these crusts yielded the following detailed results :—

Portion soluble in water	65·94
Sulphate of lime	51·23
Sulphate of magnesia	1·81
Chloride of sodium	·47
Water of combination	12·63
Portion insoluble in water	34·06
Organic matter (black carbon)	5·72
Oxides of iron of alumina	2·57
Carbonate of magnesia	·10
Carbonate of lime	19·63
Insoluble siliceous matter	6·04
	100·00

A comparison of the composition of these crusts with that of the stone upon which they were found deposited, suggests the following remarks : —

1. The greater part of the carbonate of lime, which is the chief constituent of the stone, has become changed into sulphate of lime.

Sulphate of lime and water of combination are given separately in the preceding analysis, both having been obtained by direct and separate determinations. Uniting the two together, we have no less than 63·86 per cent. of hydrated sulphate of lime in these black crusts, whilst only 19 per cent. of carbonate of lime have escaped transformation into sulphate.

2. Nearly the whole of the magnesia in the crusts is present as sulphate of magnesia, whilst it occurs in the stone as carbonate.

3. The crusts contained in round numbers 5¾ per cent. of black carbon, showing that a large proportion of soot must have come in actual contact with the surface of the stone.

4. Both the amount of oxides of iron and insoluble siliceous matters in the black deposit is very much greater than the original stone. An examination of the insoluble siliceous matter has shown me that it is of the same nature as the siliccous matter of coal-ashes. The fine particles of coal-ashes, it thus appears, are carried along with the carbon and other constituents of soot not deposited on the more sheltered portions of buildings. It has been shown before that house-coal soot contains a considerable proportion of oxides of iron, and alumina and insoluble siliceous matters in the shape of fine coal-ashes. The occurrence of fine coal-ashes in the black crusts thus shows that soot, of the same general character as house-coal soot, has been deposited on the stone.

In soot the amount of sulphate of ammonia is considerable, and as the black deposit on the stone shows plainly the presence of other soot constituents, sulphate of ammonia might likewise be expected if this salt did not act upon carbonate of lime in the presence of moisture. I have examined several specimens of deposits on calcareous stones, but in no case could I find more than mere traces of ammonia. The sulphate of ammonia in the sooty deposit in contact with water and the calcareous stone evidently has become transformed into the volatile carbonate of ammonia which escaped, and the sulphate of lime which remained behind. There can be but little doubt that such a chemical reaction takes place when a smoky atmosphere comes into contact with a calcareous stone, especially if the stone is porous, non-crystalline, and exposed to damp. I have frequently noticed that the dampest and most sooty and less-exposed parts of buildings are much more subject to decay than the more exposed parts. Now this could not be the case if gaseous constituents of the air were the chief cause of decay, which proceeds with such rapidity in limestone buildings; for if this were so, I imagine the most exposed parts of such buildings could be more easily attacked than the less exposed. But if the corroding action of the air of towns is, as I believe, more properly referred to the tangible portions of soot, it admits of a ready explanation why exactly the sheltered and damper portions of a building are more liable to decay than other parts. In the first place, it may be observed, soot will be more abundantly deposited in the crevices of fine ornamental stonework, or in places sheltered by protruding cornices, than on a plain surface wall, freely exposed to wind and weather; in the next place, it has to be borne in mind that, according to one of the first laws in chemistry, chemical reactions do not generally take place except the materials which act one upon another, or at least one of them, are presented to each other in a liquid state.

In a dry atmosphere, the deposition of soot on Bath stone would not, I imagine, produce any injurious effect; on the other hand, in a damp place, the sulphate of ammonia contained in soot will be dissolved by degrees, and then act upon the limestone, producing by double decomposition sulphate of lime and carbonate of ammonia. In a damp and sheltered position, the conditions for the gradual solution and decomposing action of sulphate of ammonia are evidently more favourable than they are in a more exposed part of a building, where rain will wash away the sulphate of ammonia of soot before it has time to act upon the stone, and the wind in a great measure prevents altogether large accumulations of soot.

The sulphate of lime produced by the action of sulphate of ammonia upon limestones in the presence of moisture, it is hardly necessary to observe, takes up water of crystallization, and thereby leads to the exfoliation of the stone. The longer the action of a sooty atmosphere continues upon limestones, the more complete will be their decomposition. In old and thick crusts, like those examined by me, we have seen that more than 60 per cent. of gypsum may occur. Had I merely analysed the surface of the crusts, I doubt not a still larger proportion of sulphate of lime would have been found.

In another specimen of a black limestone deposit from a public building, I found :—

Hygroscopic water	1·07
Organic matters (chiefly fine carbon)	5·29
Hydrated sulphate of lime	56·10
Carbonate of lime, oxides of iron, alumina, etc. (determined by difference)	34·11
Insoluble siliceous matter	3·43
	100·00

The proportion of ammonia in this incrustation amounted to only ·04 per cent., and that of nitric acid to ·115, which is equal to ·174 of nitrate of lime. Here, again, it will be noticed that the sulphate of ammonia of the soot has almost entirely disappeared, and that it has given rise to no less than 56 per cent. of hydrated sulphate of lime, by acting upon the surface of an oolitic limestone.

The effect of a smoky atmosphere on Caen stone is very injurious, particularly if the Caen stone is porous and hygroscopic. I have lately had an opportunity of noticing the rapid decay of Caen stone employed in the restoration of a church. The decay showed itself in less than three years, and was proceeding with such rapidity that Caen stone had to be abandoned in the work of restoration.

Specimens of this Caen stone, and incrustations formed upon it under the influence of the smoky atmosphere of a large manufacturing town, are placed on the table; also specimens of the stone which is now employed, and which resists better the injurious action of such an atmosphere.

The analysis of the crusts and Caen stone yielded the following results :—

Hygroscopic water	1·56
Organic matters (carbon chiefly)	4·54
Hydrated sulphate of lime	41·78
Carbonate of lime	38·93
Carbonate of magnesia	·58
Oxides of iron and alumina	·33
Insoluble siliceous matter	11·01
Alkalies and loss	1·27
	100·00

The amount of alumina in the deposit was only ·038. A nitric acid determination gave ·246 per cent., which is equal to ·371 of nitrate of lime.

Although this deposit was of comparatively recent production, it nevertheless contained a large proportion of hydrated sulphate of lime. Hard crystalline limestones, of course, resist the action of smoke better than porous soft stones; but it may be questioned whether any description of limestone is well adapted for delicate ornamental out-door work in a smoky town. If the evil of a smoky atmosphere cannot be entirely avoided in places like London, Manchester, Birmingham, &c., every care should at least be taken to mitigate as much as possible the smoke nuisance.

THE SHAKSPEARE CELEBRATION.

THE adjourned meeting of the general committee was held on Monday, his Grace the Archbishop of Dublin in the chair. Mr. Hepworth Dixon having reported fresh facts, and stated what the council desired,

Mr. Westland Marston read the following report of the special committee appointed to draw up an address to the public :—

"The National Shakspeare Committee having appointed us a special committee to prepare a public address, we beg to state that, in the absence of any report from the committee which have been appointed to consider the questions of a form and site of a memorial in honour of Shakspeare, your committee feel it would be premature to submit any address for public circulation. We beg to report for the information of the national committee that the following suggestions have met with the approval of the special committee :—

1. That a memorial be erected in London which shall afford scope for the illustration of Shakspeare's works by architects, painters, and sculptors.

2. The adoption of measures to secure a public holiday throughout the kingdom on Saturday, the 23rd of April next.

3. A performance on the same day at the Theatre Royal, Covent Garden, of music composed of the poetry of Shakspeare

4. An arrangement, if practicable, for one or more performances, dramatic or musical, from Shakspeare's works, to commence on the 23rd of April next, such performances being in addition to those which have been already promised in aid of the fund by most of the principal London managers.

5. A public dinner on the 23rd of April next.

(Signed) ROBT. VAUGHAN (Chairman). WESTLAND MARSTON. TOM TAYLOR. F. G. TOMLINS. HENRY BARNETT. SHIRLEY BROOKS. THEODORE MARTIN. W. H. DIXON."

On the motion of Mr. Deputy Read, seconded by Mr. Jonas Levy, the report was received.

On the motion of Mr. E. H. Lawrence, seconded by Mr. Godwin, it was resolved that it was desirable to raise about 30,000*l.* by public subscription for a Shakspeare memorial. An amendment was proposed to the effect that the naming of any sum was premature; but the majority present agreed with the council, that the public would desire to know something like what the views of the committee were in this respect, and, moreover, that some idea as to the amount available must be given to artists before designs could be obtained.

The Monument Committee will now doubtless meet immediately and determine the mode to be adopted to obtain a worthy design for the desired monument. The want of certainty as to the provision of funds will be a hinderance.

Amongst the suggestions as to site, Mr. Leighton names Primrose Hill, with a new avenue across the Regent's Park, connecting Portland-place with the Finchley-road, and passing the proposed site.

This is too far away for us. We want the memorial to be where every one visiting London must see it without going out to look for it, and that it should aid in the adornment of a frequented part of the metropolis.

The site we suggested, part of the Green Park opening on to Piccadilly, has pleased many persons. Such a memorial erected there as would, in the words of the special committee's report,—"afford scope for the illustration of Shakspeare's works by architects, painters, and sculptors," would add a feature to the metropolis in which the whole kingdom would have an interest, and might be made to show the world the estimation in which we hold our Shakspeare.

Since this was written, we have observed, with equal regret and surprise, that the mover and seconder of the amendment, Mr. Tom Taylor and Mr. Shirley Brooks, with seven of their supporters, have withdrawn from the committee, and published a letter, giving, as the chief reason for doing so, the resolution come to to mention to the public the amount thought to be desirable. In the case of the mover, Mr. Tom Taylor, it must be viewed as the only reason, as

e had but just then joined the committee. We old the gentlemen who have withdrawn in great steem personally, but we must be permitted to ay, the course they have taken is not one we hould have expected from them. We are not ound to defend the executive committee: a reat deal of time has been wasted, and some ant of wisdom shown. Had the gentlemen in uestion withdrawn from active co-operation on hose grounds, little wonder might have been xpressed; but that they should only just now ave come into work, condoning, as it were, any revious objections, and then immediately with-raw because they were in a minority on a ivision,—because a large majority of the general ommittee (not the *executive* committee) differed rom them on a mere question of judgment, hould a sum be named or not?—is, as we have lready said, not what might have been ex-ected from them. They would surely have one better for the cause they doubtless have at eart, if they had remained to assist in giving a ight direction to the movement. There is no uestion whatever, that delay has placed great ifficulties in the way of the committee; but hese difficulties may yet be surmounted, if all who really desire to see the 300th birthday of ur great poet properly celebrated in the metro-olis, and a worthy artistic memorial there nitiated, will give frank and loyal aid to the ork.

At Stratford, the arrangements for a glorious elebration are making very satisfactory pro-ress, and there, too, it is proposed to raise a onument. This is regrettable, as it will tend o lessen the amount obtainable for the National Memorial. More than 3,000*l.* have been already ubscribed, we are told: and the Rev. J. M. Bellew, who is working on both committees, has ssued a programme for Stratford that will doubtless take many there for a gay week. The emporary theatre, 100 feet across, is nearly eady for the roof. It is proposed to decorate it n the style of Shakspeare's period.

THE CAREER OF PAINTING AND SCULPTURE.

LIVERPOOL ARCHITECTURAL SOCIETY.

At a meeting of this society, on the 13th inst., Mr. Huggins read "A Review of the Career of Painting and Sculpture in all Ages: tracing the birth, affiliation, and mutual influences of their consecutive and contemporaneous schools, and their historical relations to the styles of architecture." It was to have been illustrated by a coloured chart, designed as a complement to his Chart of Architecture," but circumstances had caused the postponement of its exhibition to the meeting for a short time. After replying to a criticism of his previous work, he proceeded to the subject of painting among the Egyptians, which was less scientific, and in many important respects inferior to sculpture. In fact, the art of painting, properly so called, did not exist among the Egyptians, and little more could be said in reference to the arts of the Assyrians and Babylonians. After tracing the art of the Etruscans, he proceeded to that of the Greeks, which he believed did not arise till after the first settlement of Greek colonies in Asia Minor. He traced the various improvements introduced into painting by the succession of great masters from Polygnotus downwards, through the several periods of the Greek schools, to the time of Apelles, the most celebrated and excellent painter of antiquity. He traced the art among the Romans, where, he remarked, it found a very different soil from that in which it had flourished in Greece; and from the Roman he went on to the early Christian style, which, he said, was but ancient art re-animated by the new spirit which the new religion supplied, and which had received its birth and spent its earliest infancy in the catacombs of Rome, where the first Christian artists had given utterance at once to their artistic and religious feelings on the walls of their subterranean chapels and tombs. Out of the early Christian style rose the Byzantine and Longobardian, the decaying forms of which he traced through the Middle Ages, till their amalgamation in the twelfth and thirteenth centuries gave rise to the great schools of Italy. It had been often supposed, that during the dark ages all art, with all literature, was lost sight of amid the desolation and confusion that everywhere prevailed. But this was not the case. There was throughout the darkest of the dark ages a faint twilight. Some few sparks of that art of Christianity which had been born and nurtured in the catacombs, monks and bishops preserved and kept alive till they were ultimately rekindled in the thirteenth century into the living flame, which though ages ago culminating, still burnt brightly at the present hour. Mr. Huggins described the rise of the various Italian schools, beginning with the schools of Sienna, Pisa, and Florence, which latter was considered the mother of all the rest. No school was so rich in great masters of design as the Florentine, and in the history of this school alone would be included an account of almost every step of invention and improvement that had taken place in modern art. From the Florentine he went to the Umbrian, which gave birth to the Roman, of which Raffaelle was the head and greatest ornament. The Florentine and Roman schools were rather consecutive than contemporary and rival schools. The Florentine school, which was the general mother of all the rest of the schools of modern Europe, was more especially the mother of the Roman, for she jointly contributed, along with the Umbrian, to the formation of Raffaelle, the founder of the Roman school. All her great masters of design, Giotto, Masaccio, Da Vinci, Bartolomeo, Michelangelo, contributed to the education of that prince of painters, and when this was accomplished her occupation seemed well-nigh gone; for, excepting those formed in the school of the Caracci at Bologna, all the great painters in design and expression after the time of Raffaelle were of the Roman school. He traced the development of the various other schools of Italy and Western Europe—Venetian, Bolognese, Paduan, Parmese, Neapolitan, German, Flemish, Dutch, Spanish, Eclectic, Naturalistic, French, and finally the English, which was the last school founded in Europe. Though the stream of Italian and European art had thus been traced from the art of the ancients, yet painting and sculpture had undergone in their course an entire change, both in their form and spirit; and the chief regenerating influence upon them had been the new religion of Christianity, which was of another nature and spirit from its fallen rival.

CALAHORRA, SPAIN.

CALAHORRA is a quiet little city of Old Castile, situate on a rocky eminence by the side of a confluent of the Ebro,—dried up when I saw it, its course being marked by a bed of sand. Calahorra is an old Roman city, its ancient name being *Calagurris*, and there still exist the ruins of an aqueduct at some distance from the town, and a promenade has been laid out on what was I believe the hippodrome. In the "plaza" (French, *place*) of the town there is a rude painting of a woman on a pillar, holding a sword in one hand, and an arm, meant to be bloody, in the other; these form the city arms, having been adopted in consequence of the Iberian mothers, during the seige by the Romans, having eaten their own children rather than submit. The small cathedral has several points of interest. There is no tower worth speaking of, the "cimborio" at the intersection being low, though not ungraceful. The north transept door is finely sculptured in the Plateresque style of the fifteenth century, but the arches and pillars with which it is adorned are stuck about as if in defiance of architectural propriety. The nave is Gothic, the groining tolerably good, but the transepts and choir are in a very late and debased Renaissance. The chapels are, as usual, of various dates; one of them contains a magnificent marble "retablo" of the best Plateresque period, sculptured with most delicate cinquecento arabesques, and adorned with several well-carved figures, somewhat disfigured, however, by gilt frippery of a later date. Another has a very ancient picture of the patron saints of Calahorra, San Emeterio and San Celedonio, whose history is depicted more at length in a third. It is said that the heads of these saints, being thrown into the Ebro, made the tour of Spain, and came ashore at Santander, while their bodies stayed peaceably at Calahorra till the Moors took it, when they walked themselves off to the mountains, whence they were brought back in the fourteenth century. The stalls are good, but plain; the "trascoro" or screen surrounding it, a mass of niches, columns, statues, &c., completely covered with gilding, quite disfigures the nave.

In the sacristy I quite unexpectedly found some very good pictures. I had expected to find but one—a "Saint Margaret," of Titian's—but found also a copy of Rubens's "Brazen Serpent," the original of which is at Madrid (whether the copy is by himself or not I cannot tell); an "Agony in the Garden," very old, the face of our Saviour most beautiful in its expression; a "Saint Thomas putting his Finger into the Side of Our Lord;" a "Mater Dolorosa;" and a "Christ on the Cross," all of them pictures of considerable merit. There are also two half-length saints, very good; a large canvas of "The Decapitation of the Patron Saints of Calahorra;" a "Judith with the Head of Holofernes," also very good; and a "San Sebastian," the worst thing about which is the head of the saint. There is also a series of large canvases of considerable merit, representing "The Judgment of Solomon," "The Head of Naboth brought to Jezebel" (this is the only painting of the subject I have ever seen), an Annunciation, Visitation, Adoration of the Angels and of the Shepherds, &c.; and another series of small paintings on copper, representing scenes in the Passion of Jesus Christ, which last appear to be of the school of Bayeu, who, except Goya, was the last painter of any merit Spain can boast. The "Saint Margaret" is very fine; the people at Calahorra insist that it is the original of that at Madrid.

It is always very difficult to arrive at the names of the artists who painted the numerous pictures in the Spanish churches: with the exception of perhaps a Titian, Rubens, or Murillo, no one on the spot seems to know anything about them. As Calahorra is not much visited, the priests seemed quite pleased at my intrusion into the sacristy, and asking me if I were a connoisseur, "*Es Usted un intelligente*," began to point out what they considered the wonders of the place. The houses here are very substantially built, being of stone, inclosed, as it were, in a frame of brick bands and piers, forming a substantial whole, very different from the houses of Bilbao or Madrid, where, however paradoxical it may appear, the roofs are put on before the walls are built; for the ground-floor being first built of stone, an erection of wooden posts, with brackets supporting beams, which in their turn sustain the joists, is carried up to a height of four or five stories; then the tiles are placed on the roof; and lastly, the spaces between the wooden posts are filled up with brickwork, leaving apertures for windows and doors. This latter mode of building has long been the fashion in certain parts of Spain, as I find it alluded to as if in general use in one of the comedies of Alarcon, who wrote, I believe, in the early part of the seventeenth century. The bricks made about Calahorra, and, indeed, throughout the whole of that part of Castile which lies along the Ebro, and is called La Rioja, and throughout Arragon, are very good: their colour is almost that of yellow ochre, considerably darker than our white, or, rather, yellow bricks. The form of the Spanish brick approaches that of the Roman, being about 11 inches by 6 inches, and 1½ inch thick. English bricks are, however, coming into use, at least in the Basque Provinces.

W. N. L.

MR. VIGNOLES'S ADDRESS ON CIVIL ENGINEERING.

DUBLIN INSTITUTION OF CIVIL ENGINEERS.

On the 13th inst., an ordinary meeting of this society was held in the Museum Buildings, Trinity College, when Mr. Vignoles, F.R.S., the president, delivered the opening address.

In the course of it, Mr. Vignoles said it gave him much pleasure to learn that the institution had now been established on a principle which enabled them to include the members of cognate professions, viz., architects and manufacturers connected, directly or indirectly, with engineering. At an early period of the history of engineering, architects and engineers were interchangeable terms: and, even in his own recollection, there were often struggles between architects and engineers as to who are to be the proper builders of bridges. In the late competition for bridges in London, some of the finest designs, as far as the eye was concerned, were produced by architects; but, at the present day, usefulness was so much more prized than ornament, that the architects did not occupy so high an engineering place as formerly. At the same time, he might mention that one of the finest bridges in Dublin was built by an architect, and that under circumstances of no small difficulty. Those who knew the history of Essex bridge would remember that the architect of it introduced the coffer dam for the first time in the United Kingdom, that method having been invented by the celebrated French engineer,

Labeyle. Mr. Vignoles then suggested that the young engineers should take every opportunity of bringing a record of their own works before the institution, and of describing the details of important undertakings with which they might be connected. In doing so they should not indulge in fine writing, but state the facts clearly, concisely, and graphically, leaving them as a text on which useful discussions would arise. Having offered some further advice to the younger members of the profession on this subject, the president referred to the improvements which had taken place in Ireland during the last twenty or thirty years. The Lord-Lieutenant, in the course of a conversation which he had with him recently, stated that he considered it a matter of great importance that people in Ireland should turn their attention to something more than agricultural pursuits, and that he considered engineering in all its branches was one of the best guides to be adopted by those who desired to aid in the improvement of Ireland. The improvement which had already taken place was enormous, and had progressed not merely *pari passu* with that of other countries, but in a much greater degree. He thought he could trace in the whole history of Ireland, during the last fifty years, the influence of engineering in its development and progress. The Under-Secretary, General Larcom, himself a distinguished engineer, confirmed the remark of his Excellency in a conversation which he (Mr. Vignoles) subsequently had with him. In fact, as the Lord-Lieutenant said, engineering and farming must go hand-in-hand. Two centuries ago, in France, the illustrious Richelieu considered it necessary that a special school for engineering should be established, with a view to the internal improvement of the country, and he accordingly founded a school, from which many learned and distinguished men had proceeded. As a general rule, French engineers were too theoretical, and were deficient in practical knowledge. The engineer of a great work in France scarcely ever went out of his cabinet. He received a report from an engineer next to him; that engineer received a report from another. This system was carried still further down, until the whole of the practical part of it seemed to emanate from the man called the conductor of works,—a person who, in rank, would correspond with a sergeant in the army, or a foreman; but these were, in fact, the most practical men in the country. The same system was pursued in Germany, Austria, Russia, and Spain. He held, that the essence of the business of a chief engineer was, that he should not only be able to design a work, but to judge of the construction in every detail. He hoped the engineers of this country would never abandon their own system for the Continental one, and that all his hearers would ever bear in mind that engineering, as applied practically, must be learned on the ground and in the workshop. Mr. Vignoles then referred to the progress of engineering in Ireland. From the peculiar circumstances of the country forty years ago, the Board of Works had necessarily to take a great lead and to make a great number of appointments. This was distasteful to the public, and it was probably in a great measure owing to that feeling that the lines of railway laid out by Government had not been those followed by private individuals. In France a different system prevailed, the lines being not only constructed on the plans laid down by Government, but mainly by their assistance. On the whole, however, the French lines, though they were more equally distributed through the country, did not, taking account of the Government contributions, pay as well as the English railways, which were constructed solely by private enterprise. He particularly wished to impress upon all young engineers, the axiom that, in Great Britain, the success of an engineer was merely dependant on the success of his work as a commercial speculation. It was in vain for a man to say that he had constructed a great work, like a tunnel, a viaduct, or a great ship surpassing anything seen before. He might gain fame, but if his works did not pay, he would not advance in the way in which engineers expected to advance in this country. The progress of engineering in Ireland had been greater than in any country he knew of, in proportion to its extent and capital. Every time he came back to Ireland, at distant intervals, he was astonished at the improvements which he saw in every part of the country, and all of which he could trace to some part of engineering. The president then referred to the great improvements in lighthouses which had been suggested and carried out by Mr. Stoney and Mr. Cotton; to the admirable keel-buoys invented by Mr. Stoney, which had excited so much interest in London; and to the successful manner in which that gentleman had constructed concrete walls, by using a cement capable of resisting sea-water. He referred to Mr. Brett's successful contest at Arklow with the sands that threatened to close up the harbour, contrasting it with the failure of similar operations at Bayonne; and having paid a graceful tribute to the abilities and character of the late Mr. Barry Gibbons, he spoke in terms of admiration of the process by which Mr. Hudson had succeeded in consolidating and compressing peat for fuel. The drain on our coal-fields was now so great that he thought not more than a generation would pass before coal would be sold at the pit's mouth many shillings per ton dearer than at present; and if Mr. Hudson could now sell compressed peat at 8s. 6d. per ton, and make a handsome profit, what might not be realized from that source when coal became scarcer and dearer? We had in Ireland two million acres and a half of bog, covering one-fourth of the area of Ireland, available for fuel. Mr. Vignoles again eulogized the engineering school of Trinity College, and stated that he had twenty Irish engineers working as his assistants in Spain, many of whom had been educated in that college, and all of whom acquitted themselves satisfactorily. In Russia, Austria, Canada, and South America, he had heard most gratifying accounts of rising young engineers who had taken out their diplomas in that engineering school. He might mention, as successful Irish engineers, Mr. Hamilton Kenealy, who was largely employed by Government in the construction of public works in Canada; and a relative of his own, Mr. Sheilds, who is one of the best authorities on ironwork in London, and is constantly consulted on that subject. All the details of the iron framework for the great monument which is to be erected from the designs of Mr. G. G. Scott to the memory of the late Prince Consort, have been calculated and arranged by Mr. Sheilds.

ROMAN REMAINS IN CHESTER.

ON Thursday evening, the 14th, at the Society of Antiquaries, a paper on the above subject, by Mr. Tite, M.P., was read by the secretary. It appeared that in the autumn of last year, Mr. Tite was passing through Chester, when his attention was attracted to a photograph in a shop window of some apparent Roman remains, which led him to make further inquiries, when he found they were discovered in digging the foundations for rebuilding the old inn in Bridge-street, Chester, called the Feathers—a building supposed to be as old as the time of Edward III. On further examining these excavations, Mr. Tite found the distinct remains of a small temple or shrine. This temple originally consisted of twenty-four Corinthian columns, four at each end, and eight on each side. Of these ten remained in their places—that is, there were ten bases and considerable portions of the shafts. The account of the discovery appears to be the following:—In the month of June last, in digging the foundations, the workmen came upon two distinct portions of ancient buildings. On the eastern side was a space of about 23 feet square, which was supposed to be the hypocaust of a bath, from the presence of between sixty and seventy stone pillars, 32 inches high, with capitals 12 inches in size, somewhat similar to those discovered in the buried city of Wroxeter. The absence, however, of any flue tiles, led Mr. Tite to infer that these pillars were merely intended to protect from damp the superincumbent tesselated pavements. About a fortnight after the discovery of this so-called hypocaust, there was found to the north of it the base of a Roman column, 27½ inches in diameter across the top, and 4 feet 8 inches high, resting on a square block of red sandstone, standing on the maiden rock. At the distance of 11 feet 9 inches the base of a second column of similar mouldings and proportions was met with, and subsequently a third and a fourth, between the last of which are the remains of a Roman wall, 14 feet deep, cut in the solid rock. In the front of these bases, and at a distance of 39½ feet, have been discovered the bases of six columns, forming part of the other side of the temple. This was the state of things when these remains were fortunately seen by Mr. Tite. He perceived that the ruins were of the same date and character as those discovered at Bath in 1780, and which are extremely well exhibited in the works of Lysons and Carter, and also preserved with great care in the Museum of that city. Mr. Tite caused a careful plan to be taken of all the remains, in which he was much assisted by Mr. Hodgkinson. In the paper read, he stated that though in Britain, Roman walls, pavements, arches, &c., were constantly found, yet he had never before seen the remains of any columnar architecture. Even London had never produced any traces of such decorations. A restoration of the whole building, with its baths, palæstra, gardens, &c., a restoration of the temple or shrine, which must have been 110 feet long by 39 feet 6 inches in width, and a comparison of the Corinthian order at Chester and its ornaments as compared with those found at Bath, were exhibited.

INDUSTRIAL ART IN FRANCE AND ENGLAND.

A TRANSLATION of some portions of an article in the *Revue des Deux Mondes*, by M. A. de Beaumont, is given in the *Journal of the Society of Arts*. We take a paragraph or two:—"Some years ago the superiority of France in industrial art was scarcely a subject of doubt. In this domain, where clever workmanship can only exist corrected and disciplined by a taste for the beautiful, we did not know of any rivals. Even at the Exhibition of 1855 we retained the preference for ingenious inventions and productions of an elegant kind. And yet, in 1862, a remarkable event took place. French industrial art found at the Universal Exhibition of London a rival, an unexpected competitor, nearly a conqueror, in British industrial art.

How explain this sudden triumph of our neighbours? By what secret had they in five years acquired those rare qualities of which we were so justly proud? Such is the question which those who take an interest in a closer alliance between art and industry in France did not venture to put to themselves a year ago without reasonable anxiety. At the present time this question is renewed, and it would seem that at the Exhibition which has been some time opened at the Champs Elysées, French industrial art itself wished, in presence of its new rival, to examine itself as to its real strength, submit to the judgment of the public its newest productions, ascertain what progress had been made in the last few years, and ask itself what remains to be accomplished. This attention to progress in the several branches of art in which we have hitherto been considered superior, is certainly not to be denied. It testifies to a real feeling of the requirements of our period. We live in an age where positions are easily changed, and where it is necessary (and it is the same with mankind as it is with individuals) in order to secure the position already required, to increase our efforts to keep ourselves always in the right direction. Is it sufficient to know our position, to number with pride the riches we possess, to acknowledge with regret the riches we have lost? Certainly not, and France, one must own, deceives herself rather too much about exhibitions. Exhibitions repeated at short intervals cannot have any very sensible influence on art. Our neighbours proceed with less show but more logic, and here we are recalled to the question which evoked the Exhibition of 1862. That exhibition at least taught us one important fact, which is, that in barely ten years England had nearly surpassed us in applications of art to industry; but the explanation of this great advantage for England is in the part she has taken, not at the exhibitions, but in the study of art itself. These years have not been passed in admiring her own productions,—they have been passed in instructing, in strengthening herself by the study of good examples; in a word, by her developing at home instruction in industrial art in the most liberal manner.

After the great international gathering inaugurated by the Exhibition of 1851, England felt her inferiority in that sphere of industry which specially applies to art. A noble spirit, whose memory is justly revered, Prince Albert, pointed out the causes of that inferiority, and took the initiative of those improvements which in ten years have nearly changed the aspect of affairs. England possesses at the present moment 800 or 900 societies, whose mission it is to propagate a feeling for art and taste. These societies number 200,000 members, which in their turn encourage 100 schools of art, and nearly 300 private industrial schools. Museums of all kinds have been created for each industry, with public instruction and special lectures for the different

kinds of manufacture. To this development has been added the purchase of books, drawings, and engravings, which may serve as models and examples. This vast system carries with it a considerable amount of funds, and a body of intelligent men devoted to art and attached firmly to these institutions by a proper remuneration. We saw in 1862, in London, several specimens of the works of these new industrial schools of art, and we must acknowledge that if the students are not so clever as those of our schools, they arrive, thanks to the happy choice of models, at an incontestable superiority. Regarding the excellent movement of Schools of Industrial Art which England presents to us, where is France at the present time? The Exhibition of 1862 showed this to us, for there was the happy idea, which deserves to be encouraged, of bringing the schools of the whole country into that industrial competition. It is, therefore, necessary that France should know how to recognise that which England acknowledged to herself ten years ago, that her instruction in industrial art requires a complete reformation. The study of nature and the old masters, the only fruitful study which manifests itself in England in such important results, is scarcely found, except very feebly, in the drawings exhibited by the students in the Champs Elysées. The greater part of the drawings exhibited betray a bad method applied to the education of our young industrial artists, who are generally kept in a closed room facing a cast without interest, or before those tortured lithographs the laborious execution of which a child is kept for months studiously endeavouring to imitate. How much time is lost in producing these symmetrical hatchings, which make the pupil forget the object of the design, and even the subject which is being copied. If the students were only surrounded by the elegant and precious objects which ornament the palaces, perhaps their imaginations, awakened by the comparison of the beautiful, would not depart from the laws of taste; but this cold atmosphere of the school or class-room is not calculated to give to youth that pure and elevated taste which the grandeur of divine works of art alone can inspire."

NOTTINGHAM ARCHITECTURAL ASSOCIATION.

A CONVERSAZIONE was held at the residence of the president, Mr. T. C. Hine, on the evening of Wednesday, the 6th inst., and was attended by the mayor and ex-mayor of Nottingham, and other gentlemen interested in science and art, the special objects of the meeting being to hear a short paper from the president upon the architecture of Italy, which had been prepared by him from notes made during a recent tour. In order to illustrate the subject and bring it more distinctly before the mind of the hearers, a number of large photographs were hung about the room, together with sketches. The lecturer described in graphic language his own and fellow traveller's feelings as they passed that dreary "Campagna," with hillocks of mouldering earth heaving around them, as if the dead beneath were struggling in their sleep, which form the long and dreary dead sea of land around the "Eternal City." By-and-by a dull purple haze stretches level along the desert, veiling its spectral wreck of massy ruins, in whose rents the red light rests like dying fire on defiled altars; and as unutterable feelings came bubbling up at this first glimpse of the glories of bygone majesty, the travellers wondered that their charioteer showed not one spark of enthusiasm, but drove on his jaded cattle with his "whirr and whoop," as if no greatness had ever been, or no grandeur slept around; and what appeared still more shocking, upon entering the city they found long lines of streets, with gas burning in lamps, supported by lamp-posts, just such as they had left in Nottingham, and with shops, where hats, coats, shoes, and all other English wants could be supplied in English language; and at their hotel they found beefsteaks, coffee, tea, with Burton ale, and London and Dublin stout, served by waiters in slightly broken English words. This, however, was modern Rome shown by gas-light; but when the great light dispelled the mist of the coming morn from the top of the Apennine hills, then the "Eternal City" blazed forth in its awful majesty, and broken column and triumphal arch told them they were now in the city of the giants of the past. A photograph, some 6 feet long by 2 feet wide, of the forum between the Palatine and Capitoline hills, and lying in the small space called the Campo Vaccino, with the Forum of Trajan, the palace of the Cæsars, the temple of Esculapius, mixed up with convents and churches, enabled the hearers to follow the reader closely, as he led them amidst the greatness of the past to some of the present wonders. The Vatican, 1,151 feet long and 767 feet wide, with its eight grand staircases, 200 smaller staircases, 20 courts, and 4,422 apartments, and filled with the choicest antiquities, and the priceless works of ancient and modern times; and the basilica of St. Peter, 607 feet long in its central body, and 445 feet wide in the transepts, and 458 feet high, from the pavement to the cross surmounting the dome.

ARCHITECTURAL INSTITUTE OF SCOTLAND.

THE report read at the annual general meeting of the Institute, and since printed, gives the following abstract of the treasurer's accounts with the Architectural Institute of Scotland, for the year ending 31st of October, 1863:—

Charge.

Balance in treasurer's hands at close of last account		£1	12 4
Balance in account with British Linen Company's Bank at ditto		111	13 1
Arrears at 31st October, 1862		30	9 0
Annual subscriptions for 1862—63		126	0 0
Interest on account with British Linen Company to 15th April last		2	19 9
Special fund for endowing a chair of architecture, consigned in British Linen Company's Bank on deposit receipt, dated 31st October, 1862	£19 6 5		
Interest thereon for year	0 8 3		
		19	14 8
Balance due to Treasurer on 31st October, 1863		17	1 1
		£309	10 2

Discharge.

Rent, taxes, &c., paid for rooms		£17	12 0
Accounts paid for printing		23	18 6
Expenses of lithographs, medals, and drawings purchased:—			
Lithographs	£43 8 0		
Medals	6 0 0		
Drawings purchased	7 10 0		
		56	18 0
Miscellaneous general expenses:—			
Expenses connected with meetings, fitting up rooms, &c.	£18 3 4		
Treasurer for collectors and outlays	11 0 6		
Secretary's outlays for postages, &c.	3 17 6		
		33	1 1
Arrears outstanding at 31st October, 1863		48	6 0
Amount in deposit receipt of British Linen Company, on account of fund for endowing a chair of architecture		19	14 8
Balance in British Linen Company's Bank at 31st October, 1863		109	19 8
		£309	10 2

NORTHERN ARCHITECTURAL ASSOCIATION.

LAST week the annual meeting of this association was held in Newcastle, Mr. Pritchett, V.P., in the chair. Mr. Austin read a report from the committee, from which we learn that two members and two associates have been added to the association during the past year, and two members and associates have sent in their resignations, owing to their leaving the district. The treasurer's report shows a balance in hand of 5*l.* 9s. 1d., which would have been 12*l.* 15s. but for the amount of subscriptions in arrear.

The Chairman then read an address touching on various current topics. He congratulated the association on having brought together with good feelings all the architects of the district. In the course of his observations the reader said:—

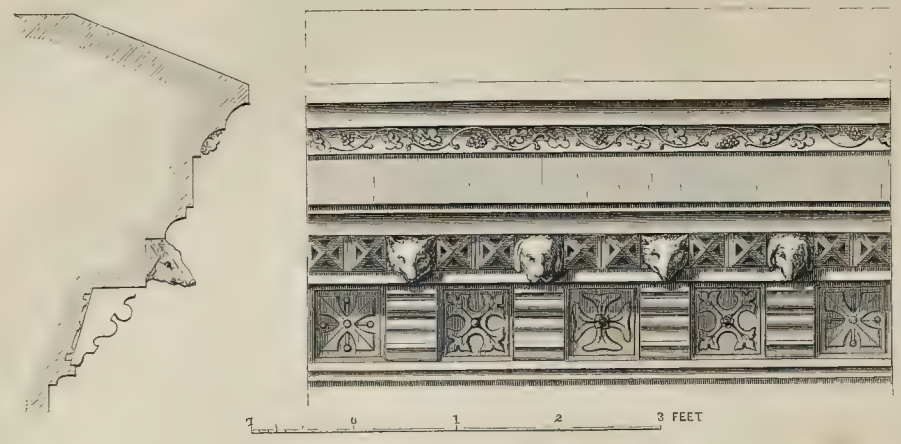
"The embankment of the Thames, though not strictly an architectural work, will have really a greater influence on architecture in the metropolis than any event likely to happen in the present century. Land is acquiring such a fabulous value in the metropolis that Government may well pause before they open any new great streets to relieve the stupendous traffic from east to west. But here we have a scheme by which a most magnificent thoroughfare is gained from a useless, unsightly foreshore: and, when both sides of the river are completed, the sail from London Bridge to Westminster Bridge will be one of the finest architectural spectacles in existence. Another project, in fair prospect of accomplishment, is a viaduct across the valley of the Fleet at Holborn-hill. This is capable of great architectural display, and, if well managed, will form a striking object. I now come to a class of structures that are rapidly rising in the metropolis, and threaten even some of our northern towns, which are equally a disgrace to those who perpetrate and those who quietly permit them—I mean the railway-bridges crossing the principal streets at low levels. Of these, the most disgraceful is the one sanctioned across Ludgate-hill, spoiling what is now the best view of the finest work of the cleverest architect of modern times. Well may we ask, what was Parliament about to allow such a scheme to be smuggled through, so that no one knew what they were about till it was too late? In vain may they make it 'an ornamental bridge:' no beauty in the obstructive can compensate for the beauty obstructed; and one of the finest views in London, the drive up Ludgate-hill, is ruined for ever, and that for a mere money-making scheme. Not so important in their results, but far more hideous in themselves, are the enormous pontoons that are being hoisted across some important streets for similar purposes. Very thankful am I to see that the Institute have taken the question up, and are going to memorialize Government to appoint a commission to lay down a comprehensive scheme for metropolitan intercommunication. It is a question we are all interested in, as we all go more or less up to town. So as soon as presented, I shall, as secretary of the Alliance, endeavour to get all the allied societies to support the memorial; believing that if the same plan had been adopted thirty years ago for the country at large, our railway system would have been far more perfect and enormously more economical than it is."

THE WORCESTER SCHOOL OF ART.

THE general meeting of the friends and supporters of this school has been held in the Guildhall, Worcester, the Earl of Dudley, in the chair. One of the honorary secretaries read the report, which stated that the progress during the past year had been satisfactory. The Government inspector, Mr. Wylde, had awarded 22 bronze medals several of them being for works in the highest class of study. At the personal examination in the second grade he passed 29 papers, and awarded 8 second-grade prizes, 20 first-grade prizes, and certificates, and his report was very favourable. At the national competition one Department prize of 10*l.* and one medallion were received by the school. The drawing classes, attended by the masters of the School of Art, at national and other schools in Worcester, had continued in satisfactory operation.

The statistics of the Worcester school and its branches, exclusive of Bromsgrove, for the year 1863, might be summed up as follows:—Total number of persons taught, either in the school or by its agency, 1,142, being an increase of five over the previous year, which included Bromsgrove; but without Bromsgrove the increase would be 223. The state of the finances was more prosperous than heretofore, there being a balance of 36*l.* 5s. 10d. in favour of the school.

The Mayor, in moving the adoption of the report, observed that it was the first time for many years that the financial balance had been on the right side.



RAILWAY MATTERS.

THE traffic receipts of the railways in the United Kingdom for the week ending January 16th, 1864, upon a mileage of 10,882, amounted to 515,503*l.*, being equal to 47*l.* 7s. 6d. per mile. For the corresponding week of last year the receipts were 474,777*l.*; the number of miles open, 10,494, or 45*l.* 5s. per mile. A comparison of the two weeks shows an increase in the aggregate receipts of 94,726*l.*, and of miles open, 388, at the rate of 105*l.* per mile. On the lines having termini in the metropolis the increase has been: On the Great Eastern, 496*l.*; Great Northern, 4,049*l.*; Great Western, 3,626*l.*; London, Chatham, and Dover, 1,242*l.*; London and North-Western, 7,180*l.*; London and South-Western, 991*l.*; Midland, 2,296*l.*; North London, 223*l.* There is a decrease upon Blackwall of 29*l.*, and on Brighton of 873*l.* In the principal lines in England and Wales there has been an increase on the Lancashire and Yorkshire of 4,043*l.*; Manchester, Sheffield, and Lincolnshire, 886*l.*; North-Eastern, 3,457*l.* A decrease on North Stafford of 1,104*l.* In the Scotch lines, the Caledonian shows an increase of 2,045*l.*; the North British, 848*l.*; the Scottish North-Eastern, 286*l.* And in Ireland, the principal increase has been upon Dublin, Wicklow, and Wexford, 670*l.*

On comparing the traffic receipts of railways in the United Kingdom, published weekly for the year 1863, amounting to 29,953,960*l.*, with those for the year 1857, amounting to 23,729,665*l.*, an increase is shown of 6,224,295*l.*, being at the average rate of 1,037,738*l.* per annum, but the increase in each year differed greatly from the average.

A public meeting of the owners and occupiers of property in the ward of Billingsgate has been held in Botolph-lane, to consider the several metropolitan railway schemes to be submitted to Parliament next session. Mr. Alderman Sidney, M.P., occupied the chair. It was determined that a petition to the House of Commons should be drawn up to restrict the sweeping away of property and trade in the City by new lines of railways, and a hope was expressed that a similar opposition would be shown in other quarters of the metropolis.

It has been proposed, says a *Wexford* paper, to present a Bill to Parliament next year for the

NEW BUILDINGS, EASTCHEAP.—*Cornice in Terra Cotta.*

formation of a railway from Gorey, in Ireland, to Courtown, and of a new pier at Courtown Harbour. The route of the proposed line of railway has been examined and pronounced favourable by Mr. H. P. Ribton, C.E., accompanied by Mr. P. J. Moran, C.E., lately connected with the Dublin, Wicklow, and Wexford line.

NEW BUILDINGS, EASTCHEAP, LONDON.

TERRA COTTA.

THE engraving in our present number exhibits the premises lately erected at the corner of Philpot-lane, occupying the site of Nos. 38 and 39, Eastcheap, for Messrs. Hunt & Crombie. They are six stories in height, including the basement, and will be used by that firm as show-rooms for colonial produce, and as offices on the ground and first stories; the remainder being devoted entirely to warehouse purposes.

The façade on the two lower stories is executed in Box ground stone; the upper stories are built of white bricks, relieved with bands of red and black brickwork, with stringcourses of stone. The fronts are divided into double and triple windows above the ground story; the openings are semi-circular, with gauged arches of red, yellow, and black bricks, with keys and voussoirs of white bricks, and stone label mouldings banding the arches. Each window is divided with detached columns of terra-cotta, having enriched capitals and bases, graceful in design and with a diversity of colour. The building is canted at the corner, and a single window with columns is there introduced on each story.

The large cornice at the top of the building is composed entirely of terra-cotta, and is nearly 4 feet in depth, having corbels, enriched pateræ, and animal heads introduced. This we illustrate more at large. The medallions in the spandrels on the several stories are also of the same material, effectively produced. Those at the corner represent the crests of the architects, and of the chairman of the trustees of the Whitechapel Charity Estates, to whom the freehold belongs. The stone capitals on the ground story, and the entrance-door and spandrels, are enriched with carving and emblematical foliage, and additional richness has been imparted to the central entrance by the introduction of the monograms of the firm, with crested shields.

Internally the construction and arrangement appear to be satisfactory. The staircases, which are of pitch-pine, present several novel features, having enclosures in lieu of balusters, perforated and cut in circles and patterns, with chamfered newels, moulded balls and pendants. The floors are carried on cast-iron girders and columns, and the sashes and doors of the ground-story are of polished wainscot, the former being filled in with circular moulded tracery springing from columns and enriched capitals. Lavatories and water-closets are provided, fitted up with Jennings's patent fittings. The roof is covered with a flat of Vieille Montagne zinc, and is approached by a staircase. The ceiling of the ground story is divided into compartments, by moulded ribs of pine, filled in with plastering.

The design may be considered as an advance in London street architecture for commercial purposes. The architects are Messrs. John Young & Son, of King-street, Cheapside; the builders are Messrs. Piper & Wheeler.

The terra-cotta work has been successfully executed by Mr. Blanchard, of Blackfriars-road; and Messrs. Nettle & Sansom, of Westminster-road, were the architectural sculptors. The total cost will be above 3,500*l*.

ACCIDENT ON THE MIDLAND RAILWAY WORKS.

FOUR arches fell, at Agar Town, on Wednesday morning last, and killed several horses. That portion of the works where this catastrophe took place is abutting on the excavations which are being made for a coffer dam and docks, to be constructed under stores which are to be erected for Messrs. Allsopp & Co. and Messrs. Bass & Co. This excavation is situate between the western side of the Regent's Canal and the King's-road, Camden Town. On the south-western side of the excavation there was, up to yesterday morning, existing a series of exceedingly large arches, forming the viaduct by which means the old road from the King's-road to the upper part of Agar Town was carried up to the level of the iron bridge over the canal, constructed some ten or twelve years since by the Ecclesiastical Commissioners on coming into possession of that portion of the Agar estate. The building contractors were Messrs. Smith & Co., of Leicester, who had sub-let their contract for pulling down these arches to Mr. Lawrence, a builder, of Hackney. Cracks have been observed in the arches for some time, but it is stated not to such an extent as to cause danger to be apprehended.

THE WATT AND WEDGWOOD PHOTOGRAPHS.

THIS interesting subject has been discussed by the Photographic Society of London, but not very favourably to the idea of either Watt or Wedgwood having been a photographer. The photograph found by Miss Meteyard amongst Josiah Wedgwood's papers has, strangely enough, been confronted with one "from the same negative" which was exhibited by Mr. Malone as having been "taken by Mr. Fox Talbot about the year 1843;" and it could not have been among the earliest of Mr. Fox Talbot's photographs, for he himself showed the writer of this one at Glasgow at an earlier date than 1843. How the photograph in question came to be amongst the Wedgwood papers has not yet been ascertained; but it seems that these papers have *not* been locked up for fifty years: so Mr. Boulton says. As to the large "photographs," though peculiar, they are regarded as specimens of printing in colours. One of the silvered copper-plates has been pronounced by Messrs. Hughes & Kimber, the copper-plate manufacturers, to be only about twenty-four years old. It is a curious fact, however, that it has been ascertained that a person named Daguerre was Wedgwood's agent for the sale of his pottery in Paris. It seems to be believed that the Lunar Society, of which Watt was a member, were engaged in photographic experiments, so that there is still some mystery in the whole affair.

THE STEPHENSON STATUE AT EUSTON SQUARE.

A VAST sum has been expended on the railway station at Euston-square. The interior, however, is not very satisfactory. This was the first London railway terminus, and a fitting style of architecture for this especial purpose had not been established. The waiting-hall is of fine proportions, and in parts excessively decorated; but this decoration is not over well applied; for, while the roof and cornices are lavishly ornamented, below, huge bare spaces are left, lacking harmony with the other. Any objects, such as pictures of those connected with the progress of road-making, canals, and railways, would tell well on this space; or perhaps, it would be better to place here a glazed copy of the large ordnance survey, which would be both useful and instructive to the large number of persons who often are obliged to wait here. Our chief object, however, in noticing this station at present is to direct attention to the neglected condition of the statue of George Stephenson, which looks, particularly as regards the countenance, as grim as when in early days he was engaged about the pits. This statue is not, upon the whole, a good one. The dress-coat is of such an indifferent fit, that it raises the idea that he could have made a better one himself: no one ever saw him wearing dress pumps, which he would kick off with the utmost contempt were he alive. The pedestal of this statue is a miserable affair, and should be replaced by a better one, which should not be so high, but broader. The name should be cut upon it too, for few know whom the statue is intended to represent. We lately overheard a gentleman of intelligent appearance telling his son that it represented Mr. Huskisson, who was killed at the opening of

NEW BUILDINGS, EASTCHEAP, LONDON. —MESSRS. JOHN YOUNG & SON, ARCHITECTS.

the first railway. Whether this be done or not, however, the statue should be relieved from the dirt which has been allowed to accumulate upon it.

INSTITUTION OF CIVIL ENGINEERS.

AT the meeting on the 12th inst., Mr. J. R. McClean, the president, delivered an address, on taking the chair for the first time since his election. It was resolved that this address should be printed and circulated with the Minutes of Proceedings. The paper read was "On the Closing of Reclamation Banks," by Mr. J. M. Heppel.

The chief objects of the paper were to bring clearly into view the circumstances which determine the velocities of influx and efflux, and consequent scour, attendant on the closing of embankments for reclaiming land from the sea, or a tideway, and constituting the chief difficulty to be overcome in executing such works.

It was shown how, by an easy geometrical process, curves might be constructed which would indicate correctly the difference of the levels of the exterior and interior water surfaces, at any given interval of time from low water; the data for their construction being the rise of the external tide water, the areas of the interior surface at the several successive levels, and the width of opening through which the flux and reflux took place.

It was contended that, in most cases, it would be better, and a safer practice, to determine in the first instance, by such means, the requisite width for the final closing place, and to construct it in such a way as to ensure its capability of resisting the scour to which it would become exposed, than to leave the closing arrangements till the banks had already advanced so far as to have given rise to considerable outward and inward current; as it was argued that, if this were done, the carrying up of the banks to each side of such final closing place would be effected with ease and certainty; and the preparations for final closing, having been made from the commencement, could also occasion no unforeseen difficulty; and that thus the whole operation would be brought more within the province of precise calculation, and adaptation of means to the required end, than according to present practice it usually was.

PRESERVATION OF BUILDING MATERIALS BY THE RESIDUUM OF COAL TAR.

IN France the residuum obtained by the distillation of tar, for the purpose of extracting the oils and hydrocarbons is called *brai* (coal-tar pitch in English). Upon immersing bricks in this resin, melted at 200 degrees, they become fit to use with success in the construction of chlorine chambers, also for condensers for chlorhydric acid. Plaster acquires a strong consistency, and does not crack as it does after being dipped in silicate of potash or soluble glass: by virtue of its porosity, it is thoroughly penetrated by the resin, and becomes permeable to all other substances; while objects moulded in plaster retain their form without the least alteration. This is so true that crystals of gypsum (natural hydrated sulphate of lime) become, in the resin, of a shining black colour, the crystalline form not being changed, but the water of hydration, being replaced by the resin: it is a pseudomorph. Alabaster acts in the same way.

Stones covered with coal tar, or even with greasy or resinous coating, resist the action of wind bringing salt-spray from the sea better than do bare stones. Mr. Kuhlman, according to *Silliman's Journal*, has discovered that resins, greasy matter, and various other substances act in the same way, and that it is also the case with all liquids and bodies in fusion, when they *wet* the body which is to be penetrated. In the case of plaster it is not a simple effect of permeability, but rather of displacement of the water; the plaster becoming anhydrous, is thoroughly penetrated by the tarry matter, and its consistence increases, but the form of the object moulded is preserved unaltered, even when the bath of resin is raised to the temperature of 400 degrees C. At from 150 degrees to 200 degrees C., stearic acid acts like resin; the plaster becomes impregnated with it, and at the same time loses its water of hydration.

WOODWORK IN ASIA MINOR.

BELOW is appended a list of the most common scantlings, plankings, and boardings in use in that portion of Asia Minor which lies between Abydos and Adrymittium. I compiled it when in that country, and it may be depended upon. The reason why I send it to you is because I was lately asked for some information as to *building materials* in Dardanelles, &c.; and as that portion of Anatolia is fast rising into importance, I thought that a copy of it would, perhaps, be useful to some of your readers.

Name (pronounced as written).	Average Length.	Average Width.	Average Thickness.	Why so called.	Remarks.
NATIVE TIMBERS, CHIEFLY LARCH, &c. English Measure.					
	Ft. In.	In.	In.		
Toprak Bitsmessie	13 0	3½	3½	From the word "*joist*."	Shows but little bark.
Araba Bitsmessie	8 0	2½	2⅔	From being easily packed and carted in "*arabas*."	Usually sawn with the bark left on.
Messera Bitsmessie	9 0	2½	1½	From a town of that name.	Very wancy and unbarked, and sold in two pieces joined at bottom.
Harhare Bitsmessie	6 6	1¾	1¾	Do. do.	Sold in three pieces, not quite sawn through like the Messera Bitsmessie.
Serai Derek	8 6	4	4	From the word "*palace*."	Picked timber for posts.
Ossea	10 6	6	6	From a tree of that name.	Barked only: sold unsawn for conversion into scantlings.
PLANKS AND BOARDS.					
Tavania	7 0	8	⅛	From the word "*roof*."	Used for roof covering.
Salichleria	6 0	5	¼	From a town in Anadol.	Used for covering gables.
Ikilcekia	6 6	6	⅛	From being once worth *two piastres*	Used for boarding partitions.
Exendaria	7 6	7	⅜	From being once worth *sixty paras*.	Used for exterior side walls.
Soubiskissee	14 0	9	1	From a river of that name.	Used for flooring.
Souvelecekia	6 0	5½	1¼	From the word "*window*."	Used for window jambs.
Maderea	10 0	8	2	From a place of that name.	Used for tiebeams.
Yermah	5 0	13	⅛	From *yermah*, Turkish for 20, the piece being generally split into 20 laths.	This is always split when nailed on the wall.
IMPORTED BOARDINGS, RED, &c.					
	About				
Venerdika, No. 5	15	16½	⅜ to 1½	From 5 stamps upon it.	The highest quality; no knots.
,, No. 4	..	14	...	,, 4 ,,	The next best, do.
,, No. 3	...	13	...	,, 3 ,,	Medium quality.
,, No. 2	...	11½	...	,, 2 ,,	Worst quality but one.
,, No. 1	...	9½	...	,, 1 ,,	Lowest quality, knotty, &c.

N.B. These Venerdika boards have always rounded ends, and holes in them, where the bolts passed through, which joined them together when being prepared for rafting down the rivers.

These native timbers are felled in the interior by the male *Turkomans*, and sawn up by the females of the encampment. They cut down part of a forest, and generally let it lie for three years before they convert it; by this means seasoning it a little, besides rendering it easier to saw. Despite the poverty of their tool-chests, the carpenters there are very clever, and a masterpiece of their work may be seen at Chigri, at a *Valonea* warehouse, owned by the *Tchelibi* Mekriditch, which is about 180 feet long, 60 feet wide, and very high. W. EASSIE.

COMPETITIONS.

Chester Townhall.—The town council of Chester, on the report of the townhall committee, which recommended the erection of a new townhall, at a cost not exceeding 16,000*l.*, to replace that destroyed by fire about twelve months since, have resolved "that the committee be authorized to advertise for designs for the new townhall, and to offer a premium of 100*l.* for the best design, and 50*l.* for the second best design, upon the terms and conditions laid before the council."

Peterborough.—The designs sent in for a new church at Peterborough, a few days ago, numbered twelve; and those by Mr. Robert Hutchinson, architect of that town, were selected in preference to the others, and he has received instructions to superintend the work.

Wigan.—The town council of Wigan have purchased land in Rodney-street, on which they purpose to erect a new gaol and corporate offices. Architects are invited to send in designs for a building, the cost of which is not to exceed 12,000*l.*; and premiums of 80*l.*, 40*l.*, and 20*l.* are offered for the best designs.

CHURCH-BUILDING NEWS.

Kensington.—St. Philip's Church, Kensington, which was built about four years ago, has now been enlarged, to meet the wants of the growing neighbourhood. The south aisle has been considerably widened, and a transept added, giving additional accommodation to an extent of between 300 and 400 sittings. At the same time, a stone and marble reredos and sedilia have been added, and some additional decorations carried out to the pulpit, the east window, &c. The organ also (by Walker) has been completed. The whole has been designed and superintended by Mr. Thos. Johnson, the architect of the church. The reredos and sedilia were executed by Mr. Farmer, and the decorations by Mr. Castell; whilst the works in the body of the church were carried out by Messrs. Holland, of Kensington, at a cost of about 1,350*l.*

Tackley (Oxfordshire).—The parish church of St. Nicholas, Tackley, which for the last eleven months has been undergoing renovation, has been re-opened. Some time ago damage was done to the church by lightning; the exterior walls having been grazed in several places, while portions of the tracery in the windows had been dislodged. The rector took the opportunity of impressing on the parishioners the necessity of a restoration of the fabric, which had, indeed, long been required. Mr. Street, the diocesan architect, was accordingly consulted, and subscriptions were entered into. The work just completed was carried out from the designs of Mr. Street, by Mr. Franklin, builder, Deddington. Three windows harmonizing with the west window of the nave (fourteenth century) have been inserted in the nave and south aisle, and the whole building has been renovated. The funds not allowing a new roof of higher pitch, principals of a later character have been introduced in the old roof. A reredos and new stone pulpit have been introduced, and low benches have superseded the old pews. The floor has also been laid with encaustic tiles. A memorial window, executed by Messrs. Clayton & Bell, of London, has been inserted by the rector at the east end; and another, of a lighter character, has been provided in the west by contributions from his former pupils. The outlay has been about 2,000*l.*, of which 350*l.* remain to be provided.

Bath.—The new cemetery at Locksbrook, for the parishes of Walcot, Trinity, and St. Saviour, in this city, has been consecrated. The cemetery is situate on a rise of ground. The site enclosed is eleven acres and a half in extent, seven and a half of which are appropriated for the church, and the remaining three and a half acres for the Nonconformists. It has been laid out by Mr. Mitchell, under the direction of Mr. Milner, landscape gardener; and the total cost to the parishes, including the buildings, will be about 10,000*l.* The chapels are in the Early Decorated style: one chapel for the church and another for Dissenters are provided. These chapels are

united by means of an arcade and carriage-way to a central tower, 100 feet high. The arcades are ornamented by columns of Devonshire marble, and relieved by carvings in freestone. A private pew, also carved, is provided in either chapel. The entrance lodge and gate are in the same style as the chapels. The chapels have been erected by Mr. Streeter, from the designs of Messrs. Hickes & Isaac, of Bath; and the carving is by Mr. Porter, also of this city. The grounds are laid out with collections of shrubs. The ancient Roman coffins found in the progress of the works, we regret to say, remarks the local *Chronicle*, are thrown aside as rubbish.

Ipswich.—The Church of St. Mary Tower is being enlarged and restored at the cost of the mayor, Mr. G. C. Bacon. The ground outside has been lowered nearer to the level of the floor inside. The nave has been heightened, the clerestory rebuilt, and a new high-pitched oak roof put on. The north aisle has been entirely rebuilt and enlarged to the width of the old south aisle, or from 13 to 20 feet, by which an additional accommodation for upwards of 100 persons has been obtained. It contains nine windows, one of which, filled with stained glass, was presented by Mr. J. C. Cobbold, in memory of his son Herbert Wilkinson Cobbold. It was put in by Mr. Wailes, of Newcastle. Mr. Day, of Ipswich, will put in a coloured window at the west end of the aisle. It will consist of three figures in floriated canopies, the figures being St. Augustin, St. Alban, and St. Edmund. Both north and south aisles have new oak roofs nearly flat, and covered with lead. The walls will be finished in colours with ornamentation. Various other improvements are to be effected, and it is intended ultimately to take down the tower, which is 70 feet high, and replace it, farther out, with one of 90 feet, after widening the south aisle to the east end. The new tower will be surmounted by a 75-feet stone spire, making the total height 165 feet. Mr. Phipson is the architect employed, and Mr. R. S. Smith the builder.

STAINED GLASS.

Louth Church.—The stained glass west window which, through the liberality of Mr. C. Parker, has just been placed in the parish church, is an illustration of the Te Deum. Messrs. Hardman, Birmingham, were the artists.

Coggeshall Church, Essex.—A stained glass window of four lights, containing four subjects, in large panels, illustrative of the life of King David, has been erected by Mr. Frederick Preedy, of London, at the expense of Mr. Thomas Sadler, of Halsted.

Watford Church.—At the parish church of Watford, the west window, of Early Perpendicular character, has recently been restored and filled with stained glass by voluntary contributions, as a Memorial of the Marriage of the Prince and Princess of Wales. The principal subject is the Marriage Feast of Cana in Galilee, and extends across the centre of the four lights, the upper portions being occupied by foliated canopies. Below are small medallions on light grounds, representing Eve presented to Adam; the meeting of Isaac and Rebekah; the Marriage of Boaz and Ruth; and that of Joseph and the Virgin Mary. The head of the window is filled in with the Royal arms of England, as borne by the Prince of Wales; the arms of Denmark; and those of the Prince and Princess of Wales, empaled; with mongrams, and the date of the marriage in the small openings. The heraldry fills portions of the window frequently treated as of comparatively little importance, and sets forth the occasion of the erection of the window, and tells its "Memorial" story more distinctly than can be done by the inscription at the bottom. The glass was designed and executed by Messrs. Heaton, Butler, & Bayne, and under the superintendence of Mr. John T. Christopher, of Watford, who acted as Honorary Architect.

St. Denis's Church, Stonton-Bickworth, Leicester.—The chancel window of this church has just been filled up by a subject representing the Crucifixion, painted by Mons. T. Dury, of Warwick. The two Marys and St. John are grouped at the feet of our Saviour, and the foliated canopy contains a figure of St. Denis. The window is the gift of Mr. J. Wright, of London.

St. Paul's Church, Warwick.—Another window, the gift of the Rev E. T. Smith, incumbent, has been placed over the font in this church, to the memory of his third daughter. The subject, painted by M. Dury, of Warwick, represents a guardian angel carrying to heaven the infant in his arms.

St. Mary's (R.C.) Cathedral, Newcastle-upon-Tyne.—Another stained glass window has been put up in this cathedral. Its style is Decorated of the fourteenth century. The subject of the design is from a group selected from the life of Saint Elizabeth of Hungary, on foliated backgrounds of a decorated character. The window is in memory of the late Mrs. Eliza Janet Charlton, wife of Dr. Charlton, whose arms and initials are inserted in the tracery. The window was from the stained glass works of Mr. H. M. Barnett, of Newcastle-upon-Tyne.

Fethard Church, Clonmel.—A window of coloured glass, in frame and mullions of Portland stone, has been inserted at the east end of Fethard Church. Mr. William Miller, of London, was the artist. The frame and mullions were wrought in Portland stone by Messrs. H. Poole & Sons, of Westminster. The design of this window is taken from the eastern window of Muckross Abbey. It consists of four compartments, with simple tracery, filled in with toned glass, the pattern being worked out with various tints of deep colouring. Foliage and ornamental scrolls with texts are inserted. A guard of galvanized wire at the back protects the glass. It is wished by some of the committee that two side east windows of coloured glass should be added, out of the surplus fund which remains with them.

STYLE IN ARCHITECTURE.

"Laugh where we must, be candid where we can."—Pope.

DEAR MR. EDITOR,—In my last little essay on "Architecture Prop-er and Shamistic," in your impression of the 2nd instant, when speaking of the influence of stucco or compo upon style, I felt that much could be said about style, but that the subject demanded a separate essay. That essay I now proceed to make.

Style in architecture exercises an enormous and peculiar influence over stylish minds. It has been remarked by a talented author on Architecture, to whom allusion was made in a former essay—Dr. Jobbins—that a building in the "Gothic style" should be "thoroughly consistent with the period of its style." What a building *not* in the Gothic style should be consistent with, he does not inform us. Whether any other style would be altogether inconsistent with everything, or if consistent in any building with anything, we are left to mere conjecture; for the Doctor is so taken up with the "Gothic style," or rather with his own crude notions of the style, that he loses himself—not like Thomson, in "light ineffable," but in *oscuro profundo*.

But then, *style*, and consistency with period—"ay, there's the rub," and also the rubbish. That a building should be thoroughly consistent with the principles of truth, and the object for which it is designed would tend to put that wretched subserviency to "period of styleism" altogether on one side. When the Elysium of Architecture is gained, and the Millennium has arrived, a principle of this sort, according to some, will be recognized, and architecture no longer be diluted by elements of copyism, puerility, and falsehood any more than Horniman's pure unadulterated tea. But as that old serpent, the devil, is still at large, architecture, with other mundane arts, exhibits the "trail" thereof.

A building should be thoroughly consistent with truthful principles, and the objects to which it is to be devoted; and if so, the style is sure to be good and pleasing; that is, of course, if the building be not in the hands of ignorance or incompetency. I am aware I may possibly be charged with Utopian ideas, but who can contemplate the architectural works that have recently been erected in the Metropolis and elsewhere upon this basis without at once acknowledging the force of this principle; a principle which, without doubt, inspired the architects of past ages, and which is happily beginning to release the architecture of the present day from the thraldom and Egyptian, Roman, and Grecian bondage in which it has so long struggled.

I visited the other day the building called the "Tabernacle," erected for the Rev. Mr. Spurgeon. Now, in this instance, we actually have no cement, but genuine stone columns, &c.; which, although ill-proportioned, are truthful and substantial. Of course, sir, the question might occur as to, why on earth, copies of a temple erected to some heathen deity (which the "devil invented," as well as Gothic architecture) should stand at the entrance of a house dedicated to the worship of the true GOD. The excellent arrangement of the interior generally, I could not stop sufficiently to admire, the ventilation being so awful that its effect, as well as that of the sermon, was lost upon me.

Near to this "Tabernacle"—more properly speaking Temple—is a most wonderful building, of cementitious development, which is called "Taylor's depository." It seems to be the central office, from whence issue those astounding pictures of railway engines, and advertisements "To families removing," which are to be met with at almost every railway station in England — caricatures of locomotives at which every honest locomotive coming into the station indignantly protests; but as the highest art here seems to be £. s. d., the public eye winks at the display of artistic feeling exhibited:—though one certainly does see illustrated advertisements at the railway stations which have more respect to truth and the public gaze.

But what has this to do with style in architecture? "Much every way." Something glaring, showy, sham, bold—something mimicking something else; something in "the decorated," "perpendicular," Grecian or Roman "style," or in the "style prevalent during the ——teenth century,"—to effect which a little "compo," mimickery, deception, and a state of mental coma are "all that is necessary."

I cannot here avoid alluding to another work; being a public building devoted to christian worship, put up by the same builders that erected the "Tabernacle." My eye was arrested by it in passing the other day along Claverton Street, Pimlico. Here the truthfulness of the "Tabernacle" has left him, for money is wasted upon huge brick cylinders coated with "compo," supporting nothing, and meaning nothing — except—but never mind.

Style, sir, is a bugbear,—that is to those who practice architecture, manufactures, baking, and plain cookery at the same time. Not that the *past* should in any way be ignored: not by any means. The past is, perhaps, our best teacher, whose form we have been portraying—or, rather, grotesquely caricaturing—instead of learning its lessons. Nor is the present devoid of moral; but, indeed, more than any previous time abundant in examples of "what to eat, drink, and avoid." But, for Heaven's sake, let there be something beyond a *reproduction* of the past or the present. Don't let us have copies of copies, and then such *bad* copies. Don't let us continue to have things in this, that, or the other "style." To adopt a past style is mere copyism; to dub any present style with a name is foppery. I have heard the architecture of the present day styled the "Victorian." This, while preposterous in its prematurity, also indicates that tendency to "finality" that exists to such a large extent in the architectural as well as the political world;—a stupid idea, that, if allowed to prevail, is simply fatal to all originality and improvement. Why, Sir, I have heard of an architect putting up the same spire sixteen times, and thinking that "the more the merrier," in point of credit; although the good people, no doubt, thought they were paying for something new and original, instead of a second-hand affair. The idea of an architect copying and recopying his own productions is almost as amusing as that of one which came under my observation of a builder-architect, whose own ideas on architecture being about worth 2d. per executed work, at every opportunity embezzled those of architects, who little imagined, in their simplicity, that their genuine thought and artistic feeling were tending to such a development (devilupment) of style. This practitioner, I was told, became jealous of his principal assistant merely *looking at* a certain public building when he himself had slyly made tracings of the competition drawings of the architect by whom the building was carried out.

This, by the way, somewhat illustrates the working of the competition system, and suggests the cause why that large quantity of elaborate designs is necessarily detained so long (now nearly two years) by the "Carlisle Bridge Committee, Dublin." Still, one would have thought, sir, that the work of appropriation, amalgamation, and tracing might have been got through by this time. As it seems there are no funds, either for carrying out the project (which the Committee must have known before the hoax) or for remunerating competitors, why not have advertised as the Aldershott people advertise,—I see in yours of the 2nd instant,—"The Committee reserve to themselves the *right* of rejecting the whole of the plans"—which is certainly cool but clear.

Now these are some of the little things that render style such a vexed question. Often have I seen in your pages discussion as to the "possibility of a new style," and many may even now be "vexing their righteous souls" from day to day hoping to be the inventors of a "new style" some fine morning, as once men were hoping to discover perpetual motion. A "new style," in this view, is chimerical; not that there is any lack of constructive or artistic ability in the *bonâ-fide* architectural profession; but I cannot believe that any building, founded on copyism, appropriation, or deception of any sort, mental or material, or having for a basis *merely £. s. d.*, will reflect credit on the architect, his employers, or, least of all, have the slightest effect in developing anything worthily distinctive in style. Although it may be thought that in this essay I have alluded to trivial matters affecting style, yet of this I am convinced, that the architecture of the present day is so affected and impregnated by such causes, that unless there be an improvement in these matters, much in the style of our architecture will be held in utter contempt by future generations; though many of the present abortions, thank heaven,

> The clumsy towers, the gim-crack palaces,
> The stupid temples, and the ugly shams,
> The ill-constructed botches bungled up
> By wretched misled mortals, shall dissolve,
> And, like the fabric of a hideous vision,
> Leave not a wreck behind.
>
> HI JACULIS ILLI DEFENDERE SAXIS.

THE NOISE FROM PAVED ROADS.

A "READER" says,—In answer to the inquiry of "A Corporation Surveyor," as to the best means of mitigating the noise from carriage-way pavements, it has been suggested that veneers of any kind of wood be placed between each course of carriage-way stones. This plan was recommended some thirty years ago, and mentioned in the *Mechanic's Magazine* as "striated pavement."

Another correspondent, "JAS. DUTHIE," says, —Pave the "sets" about 1 inch apart, fill up the joints with small clean hard stone chippings; also put a layer of these chippings, 1½ inch deep, all over the pavement, except the channels; then pour out just sufficient boiling asphalte to bind the whole together in one solid mass. Boulder pavements can also be done in a similar manner; and they are better adapted to this plan than sets, as the joints are larger and more irregular, thereby giving a greater binding principle, and causing the layer of chippings to unite with and adhere to the boulders much better than to sets. In streets or districts where heavy narrow-wheeled traffic is great, the layer of chippings would occasionally get worn through to the pavement, and require repairing, thereby causing some little inconvenience to the public.

WATER SUPPLY FOR THE SERPENTINE.

A MINIATURE TEMPLE is now being constructed on Duck Island, St. James's Park, to enshrine a steam-engine of 20-horse power, for the purpose of drawing an increased supply for the Park waters *from the sewage of Westminster*. The quality of water already furnished from that source has been found, on analysis, faulty; in fact, as the water issues from the pumps now in action, it is offensive to the olfactories; and it is not likely that the well 28 feet deep and 8 feet in diameter will yield a purer tribute when taxed more heavily.

Some six years back a well was sunk for the same object at the head of the Serpentine, Bayswater; that well, too, has been of late deepened, and is capable of furnishing double the quantity now pumped from it, and of the purest water: but the odd conceit of drawing back and circulating the stagnant pool of the Serpentine itself has been practised throughout the past summer, and one of the two small engines at work there has been used in carrying out that crotchet; while the other drew from the depths a small quantity to feed the fountains!

The condition of all our ornamental park waters discovers but too clearly that the sources of augmentation are polluted; and although constant circulation may modify the quality of the lake, it cannot adapt it for the use of the bathing frequenters of summer. Why, then, travel a mile and a half down hill to obtain and force up that supply which nature provides abundantly, and of the purest quality, at the most convenient point—the head of the lake?

The vale of the meeting of the waters, however it may have suited the fantastic imaginings or objects of some projectors, has not as yet made both ends meet, either in a utilitarian or profitable sense. Consult the working engineer at Kensington Garden well, and he will show that there is water enough in the well to employ all the power of both engines which are now employed on the divided work. A. B.

THE PEABODY BUILDING IN EAST LONDON.

THIS building, on which is being expended a part of Mr. Peabody's gift, is rapidly approaching completion, and in about a fortnight the greater number of the apartments will be occupied by tenants, who have applied in such large numbers that a selection has been necessary, and there can be no doubt that several similar buildings would find respectable tenants. This is so far satisfactory; but, after a careful inspection, we are forced, somewhat unwillingly, to say that this structure will not meet the demands of the poor, who are so much crowded together and so ill lodged in this district. We shall find here well-paid mechanics and others, who cannot be designated as belonging to the London poor, for whom provision is so much needed: and even to fit the building for the class mentioned we are mistaken if some important changes will not be required. But before alluding to these we will glance at some of the sets of apartments, each containing two rooms. The size of these two rooms is about 13 feet by 15 feet 6 inches, and 8 feet 7 inches in height; a space sufficient for the health of a small family. The ventilation has been well attended to, and the closet accommodation well cared for; the closet in which food is likely to be kept is ventilated by a window towards the open air. In the front room, which will be used as a sitting-room, there is a fire-grate, with boiler and oven, which is economical in the consumption of fuel; but in the other room there is no fire-place,—an arrangement which will be deplored when women are in their confinement, sick, &c. The want of a fireplace here will be felt particularly when we consider that there is no vestibule between the chief rooms and the corridor along which the apartments are placed on each side: the consequence being that directly the outer door is opened the room is completely overlooked; and besides, in cold weather, a current of cold air will rush in, which will be dangerous to delicate persons and young and tender children. We enter one of those corridors by an open staircase, similar in plan to those in the houses built for Miss Coutts. At the top there are two water-closets and lavatories for the men and lads, who live in the apartments in this portion of the building. At the other extreme end are water-closets for women and young children, a lavatory, baths, &c., and it should be mentioned that the arrangements and construction of these are of the best kind. There are also baths and shafts, by which the dust is conveyed to the basement. There is a plentiful supply of water laid on, and care has been taken by an exhausting process to prevent the freezing and bursting of the pipes. There will, no doubt, even when all is finished, be at times a very strong current of air along those corridors which, with the branching rooms, are at a considerable elevation. It is, therefore, most necessary for health and that degree of privacy which is much to be desired where families live, to have a small lobby to the apartments, which might be either projected into the corridor,—there would be ample space for all necessary purposes,—or there might be a partition somewhat higher than the door inside, which would break the current of air, and prevent the place from being overlooked by every one who happens to call. Matters such as these are of more consequence than may be supposed by some who have attended more to peculiar kinds of construction than the peculiar requirements and feelings of those by whom such houses are intended to be occupied. At the model building in St. Pancras-road, double doors were actually necessary for the preservation of health, and the prevention of serious bronchial and chest diseases. No one can appreciate the advantage of good ventilation more than we do; but right ventilation does not consist of violent currents of air.

Another point should not be altogether neglected in buildings of this description,—for men, women, and children are benefited by the neat appearance of the interior of their humble homes. The rooms here are, however, all in the rough; the brick courses and mortar less smoothed off than they might have been. On this point it may be admitted, that for the general purposes of health, rough walls would prove as efficient as others. Still, there is that in rough brickwork which, if even it be well whitewashed or coloured, does not prove pleasant to the eyes of neat housewives. We believe that wall-paper in tenement dwellings is, for various reasons, to be objected to; but a good coating of plaster, nicely coloured, would not much increase the cost, nor would it be injurious to health, while it would add to the comfortable appearance of the rooms, and be a nice foil to the pictures and other ornaments which the wives of the working classes like to display.

The peculiarity of the under part of this building consists in two rows of shops, each forming parts of the frontage, which will eventually form sides of two important thoroughfares. There are extensive suites of rooms (kitchen, &c.) in connexion with the shops. The shops with the apartments will be let, we are told, at a rental of about 70*l.* a year each.

If trade here should prove prosperous, the shops, &c., would assist in making up any deficiency which might arise from the apartments alone. But there are arrangements here not quite satisfactory. Some of the rooms are at a considerable distance below the surface of the footpaths, and it is said that the lower rooms are almost level with the new main drainage which has been completed here, so that it may not be a very easy matter to carry off the sewage effectually.

In many parts of the metropolis the combination of places of business with healthy dwellings above for the industrious classes might be carried out with advantage. We, therefore, look anxiously for the money results of this experiment; for if it should be proved that shops and places of business can be let at a sure rental of from 70*l.* to 80*l.* a year, it might materially reduce the rental of rooms above.

We are told that the cost of the new building will be about 22,000*l.*, and that the rent of each set of two rooms is 4*s.* per week, and that of those of three rooms, 5*s.* per week. There are a few single rooms at a lower rent.

As we have before said, these apartments will not be found to meet the wants of the poor dwellers in Bethnal-green, and in other parts of the metropolis, who can only afford to pay a weekly rent of from 2*s.* to 3*s.* a week, and more than any other class require help and care. It was expressly stipulated when Mr. Peabody's munificent gift was given, that the money was to be expended for the especial behoof of the London poor. We trust, therefore, that, although this building will not be without advantage, the directors will next direct their serious attention to supply accommodation in harmony with Mr. Peabody's original intention.

ONE WHO KNOWS.

CONCRETE BRICKS.

SIR,—I have read a report in your number of the 2nd inst., as to the patent concrete stone. Having been present at Mr. Dines's yard, Thames Bank, London, when "other specimens" of concrete stone, as well as Mr. Ransome's and Mons. Coignet's were tried and tested, having regard especially to the latter, in the presence of the gentlemen, or some of them, whose names are put forth in your report; and as Mons. Coignet's specimens stood lowest in the scale (in fact, several did not bear a ton by hydraulic pressure), I think in fairness some mention should have been made of "other specimens of stones similarly prepared."

Doubtless Mr. Ransome's productions are very excellent, and may, to some extent, supersede masons' work; but the main feature in all inventions is *cost*. Allow me to say that I have made bricks, moulded plain, comparatively non-absorbent, without burning, equal to Suffolk malms, from *sand, gravel, chalk, clinkers, road-dirt*, or *seabeach*, and, to be practical, they are to be seen in the erection of two villas at Reigate, where they have withstood the rain, sun, frost, and every-day weather; and I have no hesitation in saying, that wherever such materials as I have described are to be had, say, taken out of a basement or for a nominal sum, these bricks, or any other article—drain-pipes,

for instance, or balusters—can be made at any season of the year, and be fit for use in two or three days, without machinery or skilled labour, at a cost which will put Suffolks or any other facing-bricks in the shade; while an inferior article for inside work will compete with stocks.

These bricks and other specimens were made in the presence of the gentlemen alluded to on Mr. Dines's premises. In two months after they were tested, and I believe I am correct in stating, stood more pressure than any other concrete stone produced, viz., 12 and 20 tons; Ransome's cubes, 7, 9, and 12 tons; Portland stone, 9 and 12 tons. I have been looking forward for a detailed report of these proceedings from the gentlemen who were present, which would most likely throw a little more light on the matter, more especially as bricks are daily and yearly increasing in demand and price: I take it, therefore, any process that will tend to increase supply is of very great moment.

It is right to say, that no strain was put on any of the specimens, but simply hydraulic pressure. I have, however, no fear on that score. J. W. SUMNER.

*** The report in our pages to which the writer alludes, referred solely to a trial of one particular material at one particular place. We have no official information of the doings of the committee generally. They will doubtless publish a report themselves hereafter. The bricks mentioned by our correspondent have been described in our pages before now.

DEMOLITION.

So far from being able to help Mr. C. H. Smith in his inquiry as to some graphic records of "Canons," that meteor of pageantry and pomp, immortalised by Pope in lines that, though penned in no friendly spirit, will at any rate rescue the name of the mushroom Duke of Chandos, the founder of a palace destined to be of little less brief duration than that of ice which rose at the mandate of the imperial Russ. As to Canons, it is by no means a solitary instance of coldly and calculatingly perpetrated demolition. For, as if it were not enough that an architect's work should be especially liable to extinction by fire, it is exposed to wanton, at least deliberately planned demolition. Canons is by no means a solitary instance of ephemeral existence. The mansion at Blackheath, erected for Sir Gregory Page by the same architect, proved equally transitory; in fact, a full catalogue of more or less important buildings, which, though spared by fire, have been more ruthlessly swept away by human hands, would be a not little lengthy one, and to such as myself a rather melancholy one also. The disappearance of Vanbrugh's ultra-ponderous, elephantine Eastbury is not at all to be regretted; but some effort ought to have been made to preserve to us the princely Wanstead. Alas! that there should be a far more insatiate and inexorable spoiler than Time'—

> "One at whose touch e'en granite melts away,
> And what's for ages built lasts but a little day."

The hyperbole just uttered may be excused when we call to mind only some of the doings in our own time, of industrious destructiveness, which often masks itself under the name of improvement.

Where is now Holland's Carlton House; that work of his which forcibly, as the French say, "accused" him of being gifted with true feeling for the picturesque of architecture and for *bravura* of perspective effect? The view obtained from the first vestibule, through the deep portico to the open Ionic colonnade, and beyond that into Waterloo-place, was not a little piquant; certainly quite unmatched, nay even unapproached by aught else in our metropolis. Most fascinating, too, was the circular dining-room, even when shown in daylight *déshabille*, just before the house was dismantled. A similar fate has befallen another work of Holland's,—the India House. Neither the Ordnance Office, Margaret-street, Westminster, nor the Excise Office, Broad-street, is now to be seen except in engravings, and those merely pictorial views; for, strange to say, they are not represented technically, and so far trustworthily, in any of the publications taking the title of "Vitruvius Britannicus," although greatly more deserving of being so recorded than are very many of the subjects selected for representation, some of them being of the most hum-drum character.

Of demolition, on a tolerably large scale, we have just had a sample in the sudden sweeping away of Hungerford Market, in what may be called its infancy. Even more potent than Hannibal's vinegar, an Act of Parliament would not only saw through the Alps, but melt the whole of them quite away. With this remark I lay down my pen for the present.

AN ART LOVER.

P.S.—May I be permitted to inquire who was the Miss Patrickson who has almost Boswellized Fuseli?

ORANGE-PEEL.

PASSING down Piccadilly the other day, I saw a lady in the act of falling, but she was fortunately prevented reaching the ground by the gentleman at her side. I continued my walk to the Strand, and there, just beyond Somerset House, a gentleman who was before me suddenly slipped his legs from under him, and fell with violence to the ground. On raising him up, for he was unable to rise without help, he seemed to be fainting from excessive pain. I, with others, hastened to his assistance, and conveyed him to a neighbouring surgeon, fortunately at hand and at home. It was soon discovered that he had sustained a fracture of the small bone of the arm, complicated also with another of the elbow. This was a serious accident, and will probably be felt as such by the sufferer for the remainder of his life.

Now, both these instances,—the one so nearly occurring, and the other so disastrously accomplished,—were caused by the foot slipping over a piece of orange-peel, thoughtlessly, if not wantonly, thrown on the pavement. In the course of my walk to the City and back again to the West-End, I had the curiosity to count, as far as I could, the pieces of peel on the pavement, and I found they amounted to 151. Of course, I could not count them *all*, and it was only on *one* side of the street that I did count. The accidents arising from this cause are neither few nor far between, but are of frequent occurrence; and, though a small number of them may be noticed in the papers, the greater part of them we hear nothing about.

What is the remedy for this most treacherous street evil? A very easy one, I believe. Let it be the duty of those stately street-walkers, the police, to kick with their feet these traps for the unwary off the pavement on to the roadway, where they would be immediately rendered harmless by the traffic going on there.

There would, I think, be no difficulty in making this very simple and easy matter a part of the police duty. It would be found that it would not add much to *their work*. I should rather say it would aid to their amusement, and that they would like it as a relief to the monotony of their slow and solemn march. T. B.

THE COMPETITION FOR NEW MUSEUMS AT SOUTH KENSINGTON.

IT appears that there is to be a competition for the Museums that are to be erected on the site of the International Exhibition: let us hope that it will not turn out as great a *fiasco* as that for the Government Offices.

Most competitions notably fail to attain the object for which it is professed they are intended—that of obtaining the best possible design in relation to cost. This is partly the fault of committees, or agents who represent such amongst the public who are interested in the business; but chiefly that of architects themselves.

It is the fault of committees, because, amongst other reasons, the time devoted to the consideration of the designs submitted is ridiculously short; and because amateur judges are generally incompetent to perform the task of selection. They may be men of taste to a certain degree; and therefore it may be urged they surely may select the design that pleases them best, referring to professional advisers for matters of detail—matters of taste are not to be questioned. This, as regards architecture, I entirely deny; and as the competency of a judge depends upon the amount of taste he possesses, I will endeavour to define what is taste in matters relating to architecture. Taste may be termed the faculty of perceiving beauty. As there are two sorts of beauty, that which is external, speaking to the senses, such as that of form and colour; and that which appeals to the intellect, such as beauty of design, fitness of means to an end, propriety;—so there are two degrees of taste,—that which is natural and inherent in some men, and which leads them instinctively to take pleasure in fine contours or beautiful combinations of colour; and that which is acquired, enabling a person to judge of architectural style, character, stability, and other qualities inseparable from good architecture. The union of these two degrees of taste is required in a good judge of architectural design. The mere symmetry arising from proportion would please the man of natural taste; but the man of educated taste would not be satisfied unless he found combined with it that fitness and character which observation had taught him to look for. This is a digression; but it is intended to show that as but few amateurs can have devoted sufficient time to the study of architecture, few amateurs are competent to be judges in a competition.

But the chief fault of the failure of competitions lies with architects themselves, who, forgetful of the dignity of the art they profess, allow themselves to be treated as a better sort of tradesmen. Advertisements for competitive designs are generally considered to be pledges, on the part of those issuing them, that if architects will devote time and attention to the production of designs, they on their part will, to the best of their ability, and without favouritism, select the best design from amongst those submitted, to be carried into execution. But how are these conditions carried out? We find that all sorts of underhand means are permitted to be employed by the friends of competitors, in order to influence the decision of the committee; and even if a tolerably fair decision be reached, the architect is often "shelved" on the most frivolous pretence, or through the influence of some one on the committee, or possibly a non-competitor is employed to carry out the work.

Now, these things manifestly should not be; they involve the honour of all concerned, not only of committees or their agents, but of the whole body whom they represent. Yet architects are so accustomed to these things, that they look upon them quite as matters of course, and tamely submit to them without a protest.

But it will be asked, how are these evils to be remedied? By architects maintaining the dignity of their profession, and requiring that justice shall be done them in all public competitions. In the case of the competition under consideration, common sense calls for the following measures:

1stly. Let the instructions be clear and explicit, with some limitation as to style and expense, and let them be rigidly enforced.

2ndly. Let the judges be chiefly, if not entirely, professional men.

3rdly. Let it be understood that the successful competitor shall, without fail, be entrusted with the erection of the building.

Unless some such measures as these be taken to ensure a just decision, architects whose time is valuable to them will feel inclined to keep out of the competition. NEMO.

CASES UNDER THE METROPOLITAN BUILDING ACT.

Default of Notice.—Messrs. Glenn, builders, of Islington, were summoned to the Clerkenwell Police-court, before Mr. D'Eyncourt, by the district surveyor of South Islington, for making certain alterations at Mildmay Park Chapel without giving two days' previous notice to the surveyor, as required by the Act. When applied to, they had stated they were about to do nothing but an area wall and a little plastering; whereas, two staircases down to schools in basement had been erected. The defence was, that nothing was said of giving notice in the specification; and the "surveyor" to the work had told them it was not necessary. Ordered to pay a fine of 20s., and 23s. costs.

Insufficient Footings.—Mr. R. Walkington, of Great Suffolk-street, Borough, was summoned at the instance of the same surveyor, for having built wall of conservatory at back of No. 7, Newington-green, without proper footings. Ordered to amend forthwith, and pay costs.

Division of Buildings.—Mr. Jas. Few, Hamilton-place, Highbury-grove, was summoned by the district surveyor of South Islington for dividing a stable building, recently erected in the rear of Park-road East, Highbury, with wooden partitions, into two or more tenements, each having a separate entrance from without; contrary to sec. 27, which declares tenements so divided to be distinct buildings, and requires them to be separated by party-walls. The builder had been warned during the progress of

he building that, if it were to be divided for more than one occupation, party-walls would be required. Ordered to amend the irregularity by he erection of proper party-walls.

Books Received.

The Book of Common Prayer. With Illustrations. London: JOHN MURRAY. 1863.

THIS Book of Common Prayer is no common Prayer-book; every page has a floral border and initial letters, designed by Mr. Owen Jones; and scattered throughout there are forty outline illustrations from pictures, drawn by Mr. G. Scharf. These latter are mainly after Raffaelle and Overbeck; but, for the illustration of Public Baptism, Matrimony, &c., Mr. H. Warren and Mr. J. C. Horsley contribute drawings. Add to what we have said that the whole is beautifully printed, and the assertion that this is an uncommon Prayer-book is surely justified. The only objection we can make applies to some of the red initial letters, which are splotchy. The borders, several of them very elegant, are so numerous that the book will be suggestively useful to "designers" and decorators.

Miscellanea.

ROYAL LODGE CHAPEL, WINDSOR. — The addition of a chancel and a royal pew to the Royal Lodge Chapel, in Windsor Great Park, has been recently completed, and consecrated by the Bishop of Oxford. The style is Early Decorated, and the additions are built with Heath stone (the same as at Windsor Castle) with dressings of freestone. Mr. Teulon was the architect, and the works were executed by Messrs. Fassnidge & Son, of Uxbridge. The carving is by Mr. Earp. The east window is occupied by a rich glazing of Scripture subjects, by O'Connor.

LANDLORD AND TENANT.—Tenant's fixtures are not chattels until severed; and it is competent to a landlord to make an agreement with his tenant which shall, notwithstanding an abandonment by the tenant of his property in such fixtures during the term, in the event of an execution against the tenant, enable the landlord to re-enter and retain such fixtures against the execution creditor. This was the holding of the Court of Exchequer Chamber in the case of Dumergue *v.* Rumsey.

NEW BARRACKS FOR THE HOUSEHOLD BRIGADE AT CHELSEA.—Earl de Grey and Ripon, Secretary of State for War, has decided to appropriate the plot of land which adjoins the Hospital for Pensioners, at Chelsea, to a new barracks for one of the regiments of the household brigade of cavalry. The land on which the barracks will be erected is directly opposite the new buildings which have been erected for and recently occupied by the Guards, and covers an area of about sixteen acres. As soon as the necessary arrangements have been made the works will be immediately commenced. We may hope this is intended to supersede the threatened barracks near Walton-place, Chelsea.

EMPLOYERS AND WAGES A HUNDRED YEARS AGO.—In the July number, 1769, of the *Universal Museum and complete Magazine of Knowledge and Pleasure*, printed for J. Johnson and J. Payne, at No. 8, Paternoster-row, I find the following: "On Thursday, three eminent master tailors at the west end of the town were committed from the public office in Bow-street, for fourteen days, to Tothillfields Bridewell, for giving greater wages to their journeymen than is allowed by law." The above may perhaps be worthy of a nook in the *Builder*.—W. L.

ILLUMINATED SHEETS.—Mrs. Delamotte* has published three illuminated subjects,—Faith, Hope, and Charity,—from drawings by the late Mr. F. G. Delamotte. They have been reproduced by Messrs. Day & Son, and will doubtless please many. Charity seems to us the most successful of the three.——Of a plainer kind, but with a value of its own, is a sheet of "Directions and Precautions against Fire," intended for hanging up in places where the occasional observation of it may serve to induce calmness and presence of mind at the needful moment. It may be usefully distributed.

* 14 and 15, Beaufort-buildings, Strand.

ROYAL GALLERY OF ILLUSTRATION.—The *Opera di Camera*, "Jessy Lea," by Messrs. Oxenford & Macfarren, will, after a limited number of representations, give place to Mr. and Mrs. German Reed's new Egyptian entertainment, written by Mr. Shirley Brooks, and in which Mr. John Parry is announced to appear.

ELECTION OF SURVEYOR TO THE BIRKENHEAD COMMISSIONERS.—The road and improvement committee of the Birkenhead commission have appointed Mr. T. C. Thorburn, C.E., at present surveyor to the borough of Derby, to be surveyor to the Birkenhead commissioners, at a salary of 500*l.* a year. Mr. Thorburn is a native of Leith. The market, recently erected at Derby, was designed by him.

PRIZE COTTAGES FOR THE LABOURING CLASSES.—One hundred and seven designs for cottages have been sent in, in competition for the two prizes of 25*l.* each, placed in the hands of the Council of the Society of Arts by Mr. J. Bailey Denton, and offered for the most approved designs for cottages to be built singly or in pairs, at a cost not exceeding 100*l.* each. It will be remembered that one prize was to be competed for by members of the Architectural Association, and the other to be open to general competition. The latest date fixed for the reception of the designs was the 1st inst.

TUNNEL UNDER LAKE MICHIGAN.—A contract for the construction of a tunnel, extending some two miles under Lake Michigan, at Chicago, for the purpose of supplying the city with pure water, has been awarded; the lowest bid for completing the same being 315,130 dollars. The contract is for a tunnel of 5 feet internal diameter, lined with brick. The tunnel is to be excavated 35 feet below the bed of the lake, and to have 4 feet of dip landward. Strainers will be fixed over the outlet to keep out the fish. The total area of the tunnel will be nearly 20 square feet, an area amply large enough to furnish water continuously to a city five or six times the size of Chicago in the present day.

EXHIBITION OF GLASS; EGYPTIAN HALL. — Messrs. Defries & Co. have filled the Dudley Gallery, Egyptian Hall, with a collection of their works in glass, which will doubtless tend to spread their reputation. The principal feature of it is the colossal candelabrum in cut glass, which has been executed by them for the Rajah of Secunderabad. This marvellous work, which, together with three similar ones, has been made at a cost of 20,000*l.*, is in its general design identical with that which attracted so much attention during the last days of the Exhibition of 1862. Rising to a height of 22 feet, and expanding at its base into an hexagonal figure 7 feet in diameter, while its 145 branches of cut crystal glass radiate from the massive central shaft in three tiers, and fill an almost equal space, the eye is impressed with the magnitude of the work. What is called an Altar Piece is another *tour de force* worth notice. Some very fine specimens of engraving on glass will also be found, as well as of ordinary table glass.

TYPO-ELECTRIC TELEGRAPH.—Chev. Bonelli's invention for printing by telegraph, is being exhibited at No. 7, Angel-court, Throgmorton-street, London. The message is transmitted in the following manner:—When given in at one end of the line it is set up in type, any errors that may occur being immediately discovered and corrected ere transmission. The row of type is then placed in the machine and passed along under a species of comb consisting of five points, each of which is connected by a wire with a corresponding point at the other end of the line. Underneath these last-named five points passes a plate of platinum upon which is placed a paper moistened with nitrate of manganese. Wherever the corresponding point touches the raised letter, it completes the circle, and the electricity, acting upon the solution, decomposes it, liberating the nitric acid and leaving the peroxide of manganese upon the surface of the paper in the form of a brown deposit corresponding with the type at the other end of the lines. The paper is then washed in water to clear away the remains of the solution, and to deepen the colour of the printing, and after being dried is transmitted to its destination. A set of five wires is requisite; but the same wires are used for the up and down traffic; and 400 messages of twenty words each, it is said, have been transmitted by its means in an hour. The proprietors of this telegraph have been enabled to reduce the charges, and transmit telegrams to Liverpool and Manchester, at the rate of 6d. per twenty words.

EXPLOSION OF A SHIP AT LIVERPOOL.—An immense amount of damage to windows and otherwise has been done throughout Liverpool and Birkenhead by the explosion of 11½ tons of gunpowder, forming part of the cargo of a vessel called the *Lotty Sleigh*, bound for Africa, which took fire by an accident with petroleum or paraffine oil, which the steward was pouring out of a flask. No lives were lost. In the Exchange News Rooms alone 250*l.* worth of plate-glass was broken. Birkenhead suffered still more than Liverpool. Why was she not scuttled?

THAMES EMBANKMENT: METROPOLITAN BOARD OF WORKS.—At the last weekly meeting of the Board, the meeting went into a committee of the whole Board on the Thames Embankment, and considered a report from the solicitor as to the substitution of other securities for Messrs. Ritson & Co.'s contract for the embankment from Waterloo Bridge to the east end of the Inner Temple, than those first proposed by that firm. The competency of the sureties proposed, and of Messrs. Ritson to carry out the work, were made out to the complete satisfaction of the Board. It was therefore recommended that the securities be accepted.

SOLID SMOKE.—A working man, writing to the editor of the *British Workman*, states:—"Since I gave up smoking, I have put into a box the amount that I formerly spent every week in tobacco. At the end of the year, on opening the box, I have counted out a sum of money sufficient to provide myself with periodicals and newspapers for the year, which sum I called '*Solid Smoke!*' A friend one day called and asked me, 'Have you found the philosopher's stone?' 'No,' I replied, 'I don't turn the smoke into gold, but prevent the *gold* from turning into *smoke*.'"

SCULPTURE.—A reredos of Caen stone has been sculptured for the chapel attached to the new Beauchamp Almshouses at Newland. The subject of the sculpture is the Crucifixion, in high relief. The reredos will be surmounted by canopy work, supported by angels, and the sides will be ornamented by incised foliage, filled with dark cement. Mr. P. C. Hardwick is the architect of the reredos, and Mr. Boulton, of Worcester, the sculptor. Another work just completed by the same sculptor, is a series of bas-reliefs, to be used as tympana in the arches of the new townhall at Northampton. There are eight of these, four of which are illustrative of Parliaments held in that ancient town. Mr. Boulton has likewise executed a series of figures in wood, of angels and archangels, for the stall-ends in the choir of Hereford cathedral.

FETTES COLLEGE, EDINBURGH. — Contracts have been entered into for the erection, at an expense of about 80,000*l.*, of a college which, when completed, will be one of the greatest of the educational institutions of the city of Edinburgh. The fund for the building and endowment was bequeathed by the late Sir William Fettes, who died in 1836, in his eighty-sixth year, leaving property in the hands of trustees, which, after paying various legacies and bequests, was valued at 166,000*l.* Since 1836 the fund has increased to from 300,000*l.* to 400,000*l.* by the careful management of the trustees, and it has now been resolved to carry out the design of the testator. The site of the new building, which will be surrounded by 20 acres of playground and garden, is on the north-west of the town. The design is by Mr. David Bryce, of Edinburgh, architect, exhibiting a central tower surmounted by a spire, in a style almost entirely new to the locality.

LOCOMOTION BY HYDRAULIC POWER.—Mr. W. Symons proposes, for metropolitan underground or other railways, to have fixed steam-engines at convenient distances, whose work would be to pump water into hydraulic accumulators; this water-power under pressure to be conveyed in pipes along the railway: at proper distances wheels, as in Messrs. Hawthorn's plan, must be placed, but instead of wire ropes each set of wheels must have connected with it a small hydraulic engine; or, where two lines of rail were used, it might be placed between the two. The train, while progressing, would turn on and off the water as required, and thus no useless power would be expended. By the same sort of power he proposes to work through certain wide streets narrow lines of railway contained in and on tubular viaducts, with open latticed sides and bottoms, so as not to obstruct the light and air; these tubular viaducts to be supported on iron arches, one pillar of these arches to be in a line with the curb-stones of the street pavement, and the other against the houses.

APPOINTMENT OF ENGINEER AT THE SOUTH SHIELDS GASWORKS.—Mr. Sanderson, who has managed these works since their commencement, about forty years ago, having retired, about seventy applications were received in answer to an advertisement for his successor. Four gentlemen were selected from that number; and the appointment was, at last, obtained by Mr. Warner, of Bath.

MONUMENTAL.—It has been determined to erect a statue of Sir J. Outram in Aberdeen, where he received his early education.——A monument is to be erected in Cheshire to Field Marshal Lord Combermere. The monument is to be similar in character to those accorded to the Marquis of Anglesea and Lord Hill during their lifetime; but whether in the form of a column or an equestrian statue, has not yet been decided.

BURSTING OF SELF-ACTING BOILERS DURING FROST.—We hear of such cases this winter as heretofore. A school-room boiler at Halifax has burst, injuring a woman and breaking all the windows. Where kitchen ranges are fitted with self-acting boilers, persons ought to be careful about keeping up a constant supply of water. The danger of explosion chiefly arises when the thaw sets in, from a sudden flow of water into the dry and heated boiler. Therefore, if the feed-pipes are not well protected, and the supply of water is interrupted, the fire must not be re-lighted until the proper action of the pipes is restored. A correspondent of a contemporary, pointing out the danger arising from the freezing of pipes attached to bath-boilers, says:—"My object in writing to you is merely to point out the necessity of having for all such boilers a small spring safety-valve, capable of sustaining a pressure slightly above that of a column of water. This need not cost more than five or six shillings, and would afford perfect safety."

THE MONT CENIS TRAMWAY LOCOMOTIVE.—On the 2nd of January we noticed the intention to lay a tramway along the Mont Cenis pass, and that some experiments were being tried at Whalley Bridge. New, and it is said highly satisfactory, trials have been made with the Alpine locomotive invented and patented by Mr. J. B. Fell. This locomotive is constructed on the principle of obtaining increased adhesion without increase of weight. In the centre of the carriage-way a raised rail, considerably larger than on the ordinary lines, is laid down, and the engine and carriages are fitted with well-lubricated horizontal wheels, which, by pressing on either side of the central rail, produces the adhesion necessary for working upon steep inclines. These horizontal wheels, it is said, facilitate the passage of curves; enable the driver to stop the engine in the middle of the steepest gradient; give a propulsive pressure of several tons; and by means of the flanges which underlap the centre rail, render it nearly impossible that the carriages can be overturned. The brakes are extremely powerful.

WARMING CHURCHES AT A CHEAPER RATE.—In the *Scotsman* newspaper there are some particulars as to the warming of Dunfermline Abbey Church by means of the patent multitubular heaters of Mr. W. Clark, jun., of Dunfermline. The church seats over 2,000 persons, is lofty in the roof, and lighted by about 1,900 square feet of glass, in small panes set in lead work, far from being air-tight. The area of the church contains upwards of 425,000 cubic feet of air; and yet, according to the *Scotsman's* correspondent, this church is sufficiently warmed at a cost for fuel of from 1s. 6d. to 2s. The fire "is lighted about six o'clock on Sunday morning; by seven o'clock it is giving a large amount of fresh warm air; and by the time the congregation assembles the temperature is at 55° to 57°, or above temperate, and by mid-day there is so much heat generated in the heaters that no further coaling is required for the rest of the day. The apparatus is so constructed as to throw into the church a constant, powerful stream of fresh air from the outside, which can be heated in its passage through the heaters to a temperature of 200°, or more if required. It requires no fan-blast, or artificial force whatever, and enters the church with such volume and power that its course can be traced upwards to the ceiling, 50 feet high; and such a constant influx of fresh warm air forces off the vitiated air and prevents the disagreeable effects of cold draughts from openings left for ventilation." The plan is said to have been equally successful in various other churches and other public buildings in which it has been tried.

SLATE-CUTTING APPARATUS.—An improved apparatus for cutting thick slabs or blocks of slate has been invented by Mr. G. A. Huddart, of Brynkir, Carnarvonshire. The cutting or planing tool, which is of peculiar construction, is made to pass over the slab and cut a deep groove therein. In carrying out his invention he finds it convenient to operate with two cutting tools simultaneously, one on the upper and one on the lower side of the slab. The slab is easily broken through if the grooves be made half way, but, if desired, the slab may be cut completely through with the cutters.

AMERICAN RAILWAY SLEEPING CARRIAGES.—The New York and Erie Railway Company have just placed upon their road a sleeping-car, which is characterized as superb. It is about 60 feet long and 11 feet wide, with accommodation for fifty passengers. It is divided into three sections, each complete in itself, and each lighted by a chandelier from which the light is distributed by a radiant reflector that crowns it. The woodwork is white maple throughout. The upper or middle roof is lighted through stained-glass windows, which may be used for ventilation. Each set of berths is separated from those adjoining by sliding panels. At either end of the car is a toilet-room and water-closet, these completing the appointments of the New York and Erie sleeping-car. The road is soon to be supplied with a full stock of these cars for night travel.

THE VAUXHALL SCHOOL OF ART.—On Wednesday evening last, the chairman of the committee of management met the students of the Vauxhall School of Art, and explained that in consequence of the new minute issued by the Council of Education, the committee would be obliged to raise the fees of the school to all students not artisans; but to artisans and to those who would become such, the fees would remain as before. The committee were sorry to do this; but under the old code, when the masters had their grant from Government according to their certificates, the expenses of the school were almost more than the income would meet; and in the payment by results obtained through the artisan class of students, the money granted by the Government would be so much decreased, that if the services of the masters were to be retained, the committee of the school would have to increase their salary. It was therefore decided that the new arrangement should commence on the 1st of March, that being the beginning of a new session.

TENDERS.

[ADVERTISEMENT.]

ENGLAND AND SWITZERLAND.—"It has evidently been Mr. Benson's object to render them rivals in point of beauty of decoration to the elegant Swiss knicknacks, and at the same time to preserve the characteristics of an English watch—strength, durability, and accuracy. In point of decoration his watches are certainly unsurpassed."—*Standard*, Nov. 15, 1862. Chronometer, duplex, lever, horizontal, repeaters, centre seconds, keyless, split seconds, and every description of watch, adapted to all climates. Benson's Illustrated Pamphlet on watches (free by post for two stamps) contains a short history of watchmaking, with prices from 3 to 200 guineas each. It acts as a guide in the purchase of a watch, and enables those who live in any part of the world to select a watch, and have it sent safe by post. Prize Medal and Honourable Mention, Classes 33 and 15.—J. W. Benson, 33 & 34, Ludgate-hill, London. Established 1749. Watch and Clock Maker by Special Warrant of Appointment to H.R.H. the Prince of Wales.—[Advt.]

THE Directors of the INTERNATIONAL FINANCIAL SOCIETY, in submitting this Prospectus to the public, call attention to the ct that the Company has been established to supply an admitted want this country, where landed property is less negotiable, as a Fund of redit, than in any other of the States of Europe, in most of which rge financial associations, such as the Banks of Hypothecation in ussia, Austria, and Holland, the Credit Foncier of France, &c. &c. ake advances on Land with promptitude, at a moderate rate of Interest, and at small attendant expense.

These undertakings are all founded on the principle of the intervention of a Society, with large subscribed capital and consequent credit, nabling it to raise money on the most favourable terms, as an intermediary between borrowers, and lenders seeking investment on Landed ecurity.

The difficulty, delay, and heavy costs incurred in effecting the mortge of even first-class property, are well known; and there are numerus valuable interests arising out of Land which are at present almost holly unavailable as a source of Credit, especially in times of financial pression.

The Company will act as Agents between the investing Public and the orrower. They will also make advances repayable at fixed terms, or r terminable annuities, on Landed Estate, and on every charge upon and, such as County and Parish Rates, Rates levied on Land under ublic or Private Acts of Parliament, Royal Charters, Commissioners of ewers, Improvement Rent Charges on Private Estates, Towns Improvent Rates, Ground Rents, Harbour Trusts, &c.

All the necessary preliminary steps have been taken for applying to arliament in the ensuing Session for a special Act in aid of the Comany's operations; and with a view immediately to secure to the ompany a field for the commencement of business, provisional and munerative arrangements have been made for operations of an extensive character in connection with securities created for the Improvement of Land, under the Lands Improvement Company's Acts of Parliament, and which are preference charges on valuable private estates.

Upon the basis of the Securities thus acquired, the Company will issue Mortgage Debentures at fixed rates of interest, payable half-yearly, for shorter or longer terms, as may suit Investors; and such a system of registration will be adopted as will effectively protect the lenders from any over-issue of Debentures by the Company. It is well known that very large sums of money lie comparatively idle in the Provincial Banks, and in the hands of Trustees and private individuals, which it is believed will be readily invested through those Agencies in Mortgage Debentures founded upon real securities, and further guaranteed by a large uncalled capital, many of the securities constituting, as before mentioned, first-charges upon Land under special Acts of Parliament.

The Company, acting by their Debenture system, will be enabled to turn over their paid-up capital many times in the year. It is estimated that a working fund of £200,000, being £10 per share, would be sufficient to conduct a business involving operations of three or four millions per annum, and a moderate commission upon that amount would produce an income, which, after making the most ample deductions for working expenses and reserve fund, will leave a sum available for Dividend sufficient to remunerate the Shareholders on an unusually high scale, as proved by the large profits made by the Lands Improvement Company in the ten years they have been in operation.

The powerful landed and financial support which the Company has already obtained, insure the two elements which are essential to a commercial success—namely, a steady and constant demand and supply.

Applications for Shares must be made to the INTERNATIONAL FINANCIAL SOCIETY, Limited, at their temporary Offices, 54, Old Broad Street, E.C.

o.

CLINTON & OWENS,

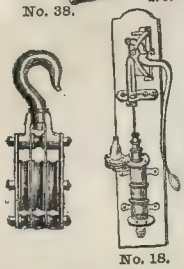
Late FOWLER & CO.

WHITEFRIARS STREET, FLEET STREET, LONDON

Pumps of every description, for Hand, Horse, Water, or Steam Power.

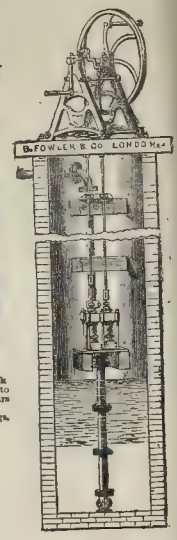
No. 38.

No. 4.



THE LANDSCAPE SKETCH ABOVE SHOWS THE IMPROVED HYDRAULIC RAM.

This is a simple Self acting Machine for Raising a considerable Supply of Water where a fall can be secured from a Stream, Brook or Springs. A great many have been fixed in various parts of the country, for raising from 600 to 6,000 or more gallons per day to elevations varying from 30 to 300 feet, and forcing through main pipes from 50 yards to several miles in length. The fullest particulars and estimates will be handed on application.



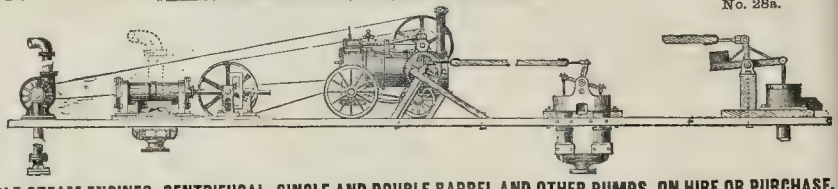
No. 28A.—Double barrel Force Pumps, for Raising Water from Deep Wells for the Supply of Tanks in Mansions and Public Buildings. Messrs. CLINTON & OWENS also Manufacture and Erect every other Form of Pump for Deep or Shallow Wells for Hand or other Power.

No. 38.—Portable Pumps, with Flexible Suction Pipes. No. 4.—Yard, Farm, Cottage, and other Pumps.

No. 18.—Brass Lift and Force Pumps, on Planks.

No. 18.

No. 28a.



CLINTON & OWENS

MANUFACTURE AND ERECT EVERY DESCRIPTION OF ENGINEERS' WORK REQUIRED IN PUBLIC OR PRIVATE ESTABLISHMENTS, SUCH AS

Architects and Builders are respectfully informed that goods of any pattern or design can be manufactured at the Company's Works, erected on the banks of the Medway by the late Thomas Cubitt, Esq. They would also call the attention of the public to the very superior quality of their Portland Cement.

TO BRICKMAKERS. —All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE OF SETTING, patented by Mr. ROBERT WHITE, and which may be seen in operation at the Brickfields of

J. B. WHITE & BROTHERS, Erith, Kent.

The advantages of this plan are two fold.

1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which in itself represents a large permanent saving.

2nd. The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks.

Licenses for use of the Patent granted to Brickmakers, on application to the Patentees, 17, Millbank street, Westminster

WHITE and RED SUFFOLK FACING BRICKS and other KILN GOODS.

BRICKMAKING, BY STEAM OR HORSE POWER,

BUNNETT'S PATENT
CONTINUOUS FEED MACHINES

Are the cheapest and most efficient, and will make from 5,000 to 20,000 bricks per day, according to the power applied and the requirements of the proprietor, at one-third less working expenses than any others.

Price 75l. including royalty, and a gun-metal die for Solid, and Perforated or Hollow Bricks.

They also make all kinds of Sanitary Pipes, Tiles, or Moulded Bricks, of a superior quality.

LICENCES GRANTED TO MANUFACTURERS.
For particulars apply to BUNNETT & CO. Engineers, Deptford, Kent, where the Machines may be seen at work.

OCTAVIUS N. SIMPSON, STAMFORD;
and see Specimens at the Office of
Messrs. PINDER SIMPSON & SONS, 29, Savile-row, London, and at the Museum of Practical Geology, Jermyn-street, W.
This stone (which is a perfect oolite) is raised in blocks of any portable size, and is about four feet thick in the bed. It will stand ANY WEATHER, is much used for water-works, and for the building and restoration of churches. When used as ashlar work it is not necessary to place it bed-wise. It works freely with a tooth-saw, and is wrought at a cheaper rate than any stone in the kingdom.

*** The above WEATHER STONE is 1s. 9d. per cubic foot, delivered in London.

G. MITCHELL

VENTILATION—PURE AIR.
Sheringham's Day and Night Ventilator

for the admission of Pure Air.
THROUGH THE EXTERNAL WALL.
These Ventilators are arranged so that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street Borough, London.

FULLER & HORSEY, 11, Billiter-street, E.C.

TO TIMBER-MERCHANTS AND OTHERS

MR. WM. HODSOLL will SELL by AUCTION, at the BLACK BOY INN, St. Mary's Cray, Kent, on THURSDAY, JANUARY 28th, at TWELVE o'clock, the above superior ELM TREES, chiefly of large dimensions; also a few cherry trees, a quantity of elm poor wood and bushes, and 12 acres of coal all underwood of the whole standing within a short distance of the Cray railway station.—May be viewed at any time, and catalogues had of the Auctioneer, Farningham, Kent.

CHARING CROSS RAILWAY.—CITY TERMINUS.—To BUILDERS, CONTRACTORS, PAVIORS, and OTHERS

MESSRS. WILLIS & HARROW are favoured with instructions from the Contractor to SELL by AUCTION, on the PREMISES, on FRIDAY, 29th JANUARY, 1864, at ONE o'clock punctually, the valuable MATERIALS of THE DWELLING-HOUSES and WAREHOUSE, in Bush-lane, Upper Thames street, Chequer-yard, and on Dowgate-hill; comprising several tons of lead, in pipes and gutters; plain and pan tiles on roofs; sash-frames and glazing, good flooring boards, stout timber and joists, excellent sashes and frames, lobpole and other doors and frames, iron guards, cranes, wood pile, and a variety of useful fixtures and fittings up.—May be viewed the day previous and morning of Sale, and catalogues had on the Premises, at the Contractor's Office, 1, Wormwood-street, Southwark, and of Messrs. WILLIS & HARROW, Auctioneers and Surveyors, 3, Newman's-court, Cornhill, E.C. and West Molesey, Kingston, Surrey.

CHARING CROSS RAILWAY, CITY TERMINUS

TO BUILDERS, CONTRACTORS, PAVIORS, AND OTHERS.

MESSRS. WILLIS & HARROW are favoured with instructions from the Contractor to SELL by AUCTION, on the PREMISES, on TUESDAY, 26th FEBRUARY, 1864, and following day, at ONE o'clock punctually, the valuable and useful MATERIALS of several houses and warehouses on Dowgate-hill, in Chequer-yard, Bush-lane, and Scott's-yard, comprising several tons of lead in pipes and gutters, plain and pan tiles on roofs, stone sills, good flooring boards, stout timber and joists, excellent sash-frames, lobpole and other doors and frames, iron guards, cranes, wood pile, and a variety of useful fixtures and fittings up.—May be viewed the day previous and morning of Sale, and catalogues had on the Premises; at the Contractor's Office, Worcester-street, Southwark; and of Messrs. WILLIS & HARROW, Auctioneers and Surveyors, 3, Newman's-court, Cornhill, E.C. and West Molesey, Kingston, Surrey.

No. 102, LOWER THAMES STREET, CITY.—BUILDING MATERIALS

MR. T. SIDNEY SMITH has been instructed by Messrs. Overall, Sons, & Co. who are rebuilding, to SELL by AUCTION, on the PREMISES, on THURSDAY, next, JANUARY 28, at TWELVE for ONE, several Tons of LEAD, cisterns, doors, partitions, sash-frames, York paving, &c.—Catalogues of the Auctioneer, 43, Lombard-street.

FREEHOLD MILLS, with good Water-power, Keynsham, Somerset, well adapted for Corn Mills, Oil Mills, or Paper Mills, TO BE SOLD.—Apply to Messrs. FULLER & HORSEY, Billiter street, London, E.C.

WATERSIDE PREMISES.—TO BE LET, on lease, a capital WHARF, having a frontage, of 127 feet, to the City-road Basin. The buildings comprise counting-house, warehouse (containing four rooms), corn and chaff stores, stabling for 12 horses, with large yard and large yard adjoining, eight-horse mill, chimney shaft, smithy, carpenter's shop, &c. the total superficial area being 16,456 feet.—For further particulars apply to Messrs. FULLER & HORSEY, 13, Billiter-street, E.C.

ELIGIBLE FREEHOLD BUILDING LAND, in the CITY of OXFORD.—The Guardians of the Poor of the Oxford Incorporation will offer for SALE, during the course of next Spring, the SITE of the present WORKHOUSE, in the City of Oxford, containing five acres or more. Further particulars may be obtained of W. JACOB, Clerk to the Guardians, Oxford, December 10th, 1863.

TO BUILDERS and OTHERS.—TO BE LET, several PLOTS of BUILDING LAND, situate in the best part of Stoke Newington, where houses are in great demand. Bricks supplied on the estate at a low price. Sand may be raised on the ground for building purposes.—Apply to Mr. ROUDA, at the Estate Office, Bouverie-road, Church-street Stoke Newington.

A FREEHOLD MANSION TO BE SOLD.

The elegant Farm Estate may be had at a valuation. There are four reception-rooms, one being 24 feet in length; eleven best bedrooms; stabling for eight horses and four carriages; suitable servants' offices; extensive ornamental grounds, with green-houses, in all 24 acres; gravelly soil; near Sunningdale Station, South-Western Railway, half a mile from Windsor Great Park, and fifty minutes from the Waterloo Station.—Apply to J. MAY, Esq. Solicitor, 67, Russell-square.

KEYNSHAM BLUE LIAS LIME and CEMENT WORKS, Somerset.—TO BE SOLD, by PRIVATE CONTRACT, by the Proprietor, the Liquidator, the newly-formed FREEHOLD WORKS, occupying a site of 7 acres, 2 roods, and 26 perches, or thereabouts. The existing kilns and sheds are capable of producing 700 to 800 bushels per week, and 120 tons of cement weekly, both produce being approved of by large contractors and eminent architects, the cement being used in many of the Government fortifications now in progress. The buildings are very substantial and the machinery as if the best description, driven principally by water-power, but with steam power as an auxiliary. Coals are supplied to the works at a very low price, and the Midland Western Railway Station is within a short distance.—For further particulars, apply to Messrs. N. LINDO & SONS, Solicitors, 47a, Moorgate-street; to F. MAYNARD, Esq. Liquidator, 19, Broad-street, Bristol; and to Messrs. FULLER & HORSEY, 13, Billiter-street, London.

WHARF.—TO BE LET on LEASE, a WHARF, 200 feet deep, and river front 178 feet 6 inches, with dwelling-house, and large quantity of timber-shed, &c. at Cumberland Wood-wharf, Poplar.—Apply to the Wharfinger, on the Premises; or Mr HARVEY, 24, Holywell-street, Westminster.

BUILDING LAND TO BE LET.—PARAGON ROW, LOCK'S FIELDS, WALWORTH, SURREY, within five minutes' walk of the Elephant and Castle.—To BUILDERS, MANUFACTURERS, WHOLESALE TRADERS, and OTHERS, requiring space for building and business premises. The Fishmongers' Company are ready to receive TENDERS, on a Building Lease or Leases, for the GROUND, about two acres, at the east end of Paragon-row, Lock's-field, now in the occupation of Messrs. Waring & Co. It is a rectangular plot, about 663 feet in length, and of about 131 feet average parallel width well adapted for dwelling-houses or business premises requiring space.—For conditions and particulars, inquire of Mr. W. B. TOWSE, the Company's Clerk, Fishmongers' Hall; or of Mr RICHARD SUTER, Architect and Surveyor, 24, Fenchurch-street. The Tenders to be sent in by TUESDAY, the 16th of FEBRUARY next, at NOON precisely.

Fishmongers' Hall, 19th January, 1864.

PANGBORNE, BERKS.—Valuable Freehold Land, within five minutes' walk of the most beautiful part of the river Thames and of the railway station, and about one hour's journey from London. TO BE LET, in large or small lots, about 20 ACRES of CAPITAL BUILDING ground, admirably adapted for gentlemen's residences and villas, delightfully situated, with fine views of the country and river scenery.—Apply to W. J. RATCLIFFE, Esq. Solicitor, Hyde, Isle of Wight; or to F. NEWMAN, Esq. Surveyor and Architect, Ryde, Isle of Wight.

TO BUILDERS.—LAND TO BE LET for BUILDING, at Camberwell and Rotherhithe.—Apply to Messrs. FINCH & CO. 17, N. Bank-street, Westminster.

HARROW.—ROXBOROUGH PARK.—FREEHOLD LAND TO BE LET, on 80 years' leases, for building VILLA RESIDENCES, in the vicinity of the School, on the slope of the hill, towards the railway, from which it is distant about three-quarters of a mile. The occupant of each house would be entitled to the privileges of the season tickets for the children, and would have a free pass by railway to London for eleven years. Bricks made on the estate.—For particulars, apply at Mr. HESKETH'S Office, No. 7, Royal Exchange, E.C.

TO BE LET, by the Fishmongers' Company of London, on a building lease, for eighty years, valuable BUILDING LAND, Newington, Surrey, within three minutes walk of the Elephant and Castle; about three quarters of an acre of Ground, situate on the east side of the Walworth road, having a frontage of 145 feet to that road, and a frontage of 176 feet 6 inches in Prospect-row; and Eighteen Cottages in the rear, in William's-place. This property is well adapted for shops and business purposes, or dwelling-houses, and is likewise one of the principal thoroughfares of the district.—The Lot or Lots to be taken in one or more lots, to suit the views of different parties wanting the ground.—Apply to Mr. W. B. TOWSE, the Company's Clerk, Fishmongers' Hall, London Bridge; or to Mr. RICHARD SUTER, the Company's Surveyor, 24, Fenchurch-street E.C. where plans and particulars may be seen. The Tenders are to be sent in by MONDAY, the 15th of FEBRUARY next, at NOON precisely.

Fishmongers' Hall, 19th January, 1864.

WANTED, YARD or PREMISES suitable, or that can be adapted, for a Builder, within half-a-mile radius of Portman square. Depth not less than 60 feet. Entrance accessible for carts, long scaffolding, &c. No shop required.—Address, stating rent and full particulars, to S. Office of "The Builder."

TO MASONS, JOINERS, PLUMBERS, SLATERS, PLASTERERS, &c.—TO BE LET, the various WORKS required in the erection of a Wesleyan Chapel, at SKIPTON. Plans and Specifications may be seen and bills of quantities obtained at our Offices, Bradford, on MONDAY, JANUARY 25th, until FRIDAY, JANUARY 29th; and of Mr. AILEN, Wesley-place Day School, Skipton, between the hours of TEN and FIVE, from SATURDAY, JANUARY 30th, until 1st February next, by which last day sealed Tenders, endorsed "Tender for Chapel," must be sent to the Secretary, Mr. JAMES TASKER, stamp office, Skipton. The lowest Tender will not necessarily be accepted.—By order, LOCKWOOD & MAWSON, Architects.

Post-office Buildings, Bradford.
10, Lincoln's-inn Fields, London.

SYDENHAM HILL.—LAND TO BE LET, for Building, 430 feet frontage, average 300 feet deep. Beautiful site, with extensive prospects, and fronting a high road. Close to the railway stations, and within ten minutes' walk of the Crystal Palace. May be had in one, two, or three plots, for detached residences.—For particulars, apply personally to Mr. HENRY DAWSON, Architect, 16, Finsbury-place, South, E.C.

ARGYLL HOUSE.—Lord Aberdeen's late Residence.—The handsome Marble Chimney Pieces, Painted Panelled Doors, Wainscot, and other Fittings, highly ornamental Architraves, and a great variety of other Fittings and Fixtures, TO BE SOLD.—Can be seen every day between TEN to FIVE o'clock, at Argyll House, Argyll-street, Regent Circus.

London: Printed by CHARLES WYMAN, Printer, at the Printing-office of Cox & Wyman, Nos. 74 and 75, Great Queen-street, Lincoln's-inn-fields, in the Parish of St. Giles-in-the-fields; and published by the said CHARLES WYMAN, at the Office of "THE BUILDER," No. 1, York-street, in the Parish of St. Paul, Covent-garden, both in the County of Middlesex.—Saturday, January 23, 1864.

THE ARCHITECTURAL MUSEUM, SOUTH KENSINGTON MUSEUM, W.

PRIZES FOR COLOURED DECORATION.

5l. 5s. and 3l. 3s. are now offered. The Competition will be open till MARCH 1st, 1864. Casts for colouration, price 5s. and full particulars may be had by letter to the Honorary Secretary, at 13, Stratford-place, W.

A. J. B. BERESFORD HOPE, President.
GEO GILBERT SCOTT, Treasurer.
JOSEPH CLARKE, Hon. Sec.

All requests for Casts for Colouration must be accompanied by a Post-office Order on Charing-cross for 5s.; or if cast and packing required, 7s.

BILLING'S PATENTS.—CHIMNEY TERMINALS.—THROAT VALVES.—NOTICE to ARCHITECTS.—The Proprietors of these PATENTS have given the Widow an interest in the same, and have considerably reduced the price of the Articles, trusting that by so doing these useful Inventions may be introduced more generally in all new buildings.—For prices, apply to the Manager, Mr. TYLER, 13, Abingdon street, Westminster, who will also afford any information, he having been for many years engaged with the late Mr. BILLING, in the practical curing of Smoky Chimneys.

BY ORDER of the TRUSTEES of the SOANE MUSEUM.—The MUSEUM, 13, Lincoln's-Inn-fields, will be OPEN this season on the Wednesday in each week in the months of February, March, July, and August; and on the Wednesdays, Thursdays, and Fridays in April, May, and June. Cards of admission to be obtained of the Curator, at the Museum; or from the Trustees.

BY ORDER of the SECRETARY of STATE for INDIA in COUNCIL.

Notice is hereby given, that TWENTY FIVE APPOINTMENTS in the UPPER CLASS of the ELECTRIC TELEGRAPH DEPARTMENT in India will, in the year 1864, be open to PUBLIC COMPETITION.

A Competitive Examination will, accordingly, be held in this office in the month of MAY next. Full printed particulars of the conditions on which candidates will be admitted to the Examination, and also respecting the nature of the Appointments to be competed for, may be obtained at this Office, on application, either personally or by letter, addressed to the "Under Secretary of State for India," India Office, London, S.W.

November 20th, 1863.

NOTICE.

BROWN & GREEN'S KITCHEN RANGE WAREHOUSE is now REMOVED to the NEW PREMISES, 72–74, Bishopsgate-street Within, a few doors from the late Address, at No. 81. These afford accommodation for a still larger stock of their Patent Prize Medal Ranges and Stoves. Register Grates, and Cooking Utensils, to meet the great public demand; and also for the consequent more extensive execution, by the manufacturers themselves, of all descriptions of hot water, bath, laundry, and steam work.

72–74, Bishopsgate-street Within, November, 1863.

MARYLEBONE and WEST LONDON SCHOOL of ART, 203, PORTLAND ROAD, W.

President—A. J. B. BERESFORD HOPE, Esq. M.A. D.C.L. &c. &c.

NOTICE.—The ANNUAL EXAMINATION in Drawing, before the Government Inspector, will take place in MARCH. Persons not taught in the School may present themselves for Examination without any Fee, and are equally eligible with the Students to receive the Certificates and Prizes granted by the Government. Special EXAMINATION CLASSES are formed in the School for qualifying in the above subjects of examination. Former Students will be provided for in these classes; and as long as there is room, strangers may join them.

30th January, 1864.

COMPETITIONS.

TO ARCHITECTS. — CHESTER NEW TOWN HALL.—The Town Council of the City of Chester are prepared to receive DESIGNS for a NEW TOWN HALL, with POLICE OFFICES and LOCK-UPS, proposed to be built upon a site belonging to the Council situate in Northgate-street. Architects wishing to send in Designs may obtain a plan of the site and particulars and instructions upon application to me, the undersigned, at the Public Offices, Lower Bridge-street, at which place the Designs must be delivered, free of cost, on or before the 2nd day of MAY next. A premium of 100l. will be paid to the author of the DESIGN to which the Council shall award the first place, and a premium of 50l. to the author of the Design to which they shall award the second place; both of which Designs thereupon to become the property of the Council. But should the author of either of the premiated Designs be employed to carry out the work, the premium awarded to him will be deducted from his commission, which will be 5l. per centum on the outlay. If the Designs sent in are not, in the estimation of the Council, of sufficient merit, the premiums will not be given.

JOHN WALKER, Town Clerk.

Public Offices, Lower Bridge-street, Chester, 18th January, 1864.

NEW WATERWORKS at RIPON.—To ENGINEERS and OTHERS.—The Council of the City and Borough of Ripon, acting as the Local Board under the Local Government Acts, having determined upon providing their District with a supply of pure and wholesome water, constantly laid on at such pressure as will carry the same to the top story of the highest dwelling house within such district, hereby offer a PREMIUM of FIFTY GUINEAS for the best and most practicable SCHEME for obtaining such a supply. Full particulars of the plan proposed, with all necessary specifications and estimates of the cost of carrying out and working the same, are to be left, in sealed covers, pre-paid, and marked on the outside, "Waterworks' Plan," at my Offices, in Ripon, on or before the 8th day of MARCH next, where, meantime, further information may be obtained. The Council are not to be liable to make any recompense or other payment to unsuccessful competitors; nor do they pledge themselves to employ the person whose plans may be preferred, but, if not employed, the above-named premium will be given, and such plans, specifications, and estimates will remain the property of the Council.—By order,

R. W. NICHOLSON, Town Clerk.

Ripon, January 25, 1864.

BOROUGH of WIGAN, in the county of Lancaster.—To ARCHITECTS and OTHERS.—The Corporation of the said Borough of Wigan are desirous of receiving and hereby invite Architects and others to send in DESIGNS, PLANS, SECTIONS, ELEVATIONS, SPECIFICATIONS, and ESTIMATES for the ERECTION of a BOROUGH GAOL, containing not less than fifteen cells for prisoners, a house for the chief-constable, also a house for the gaol keeper; fire-engine-house for three engines, with space for the necessary apparatus; police court and sessions room, recorder's retiring-room, barristers' robing room, attorneys room, grand jury room, petty jury room, a general purposes room (lavatory, bath-room, and kitchen for the prisoners in the basement fronting Chapel-lane), and all other necessary offices for the transaction of the business of the Local Board of Health of the said district and borough of Wigan. Plans to be of a uniform scale of an eighth of an inch to the foot. The cost of the entire building shall not exceed 12,000l. The population of Wigan is about 49,000. The person who, in the opinion of the Town Council of the said borough, produces the best design, plan, section, elevation, specification, and estimate to receive 50l.; the second best to receive 40l.; and the third best, 20l. The designs, &c. for which premiums shall be awarded shall become and be the property of the Town Council of the said borough, but the Council do not bind themselves to carry out the same design, &c. or employ the architect producing them, and will be at liberty to modify the same in any way they may think proper, and in the event of his being selected for that purpose the premium to merge in the architect's commission.

Each set of designs, &c. &c. must be distinguished by a motto and accompanied with a sealed envelope containing the name and address of the competitor, and having a similar motto to that on the design, plan, &c. which envelopes will not be opened until after the plans are decided upon. The designs, &c., and everything intended to be submitted therewith, must be enclosed in a sealed cover endorsed "Plan for Borough Gaol, &c." and addressed to C. HILTON, Town Clerk, Wigan, and be delivered on or before the 10th day of MARCH next. The Town Council will pay to the Architect selected to carry out the work a commission of five per cent. on the outlay, to include all plans, sections, specifications, drawings, estimates, elevations, and all attendances necessary to complete the same, and no charge or extras of any description will be allowed. All the plans, &c. except the premium ones will be returned, carriage free, on application to me, and no further liability by the Town Council or claims to remuneration will be allowed in respect to the plans, &c. received beyond the amount of premium herein set forth. A block plan of the site, and any further information that may be required, can be had on application at my Office on payment of the sum of five shillings for each plan.

Wigan, January, 1864.

C. HILTON, Town Clerk.

TO ARCHITECTS.—VILLA and COTTAGE RESIDENCES.—The Directors of the Manchester Villa and Cottage Association (Limited), offer 50l. PREMIUM for the BEST DESIGN, and 25l. for the 2nd best Design, for FOUR COTTAGES and SIX DWELLING HOUSES.

First a Row of Four Cottages, not to exceed 150l. each in cost.

Secondly, a Group of Two Houses, not to exceed 200l. each in cost.

Thirdly, a Group of Two Houses, not to exceed 350l. each in cost.

Fourthly, a Group of Two Houses, not to exceed 500l. each in cost.

The plans and drawings, at a scale of 1in. to 1ft. with figured dimensions, to be sufficient to show the respective designs, and to be accompanied with a general description of the materials and finish. Plans of proposed sites for the groups may be had from the Secretary. Buildings undertaken by the Association may be built under the superintendence of any architect nominated by the person or persons who covenant to purchase them when built. Messrs. COMBERT & BABY, the Architects and Surveyors to the Association, will not compete for the above, but will assist the Directors in adjudicating the premiums. The designs to be sent in to the Secretary, sealed and endorsed "Designs for Villa and Cottage Residences," on or before the 30th of APRIL next, marked with a motto, and with sealed envelope containing Architect's address, or signed with name instead of motto, if preferred. Designs not adjudged to receive the premium to be returned.

JOHN WORTHY WILLIAMS, Secretary.

Offices, 36, Market-street, Manchester, January 15, 1864.

PENARTH HARBOUR, DOCK, and RAILWAY COMPANY.—NOTICE to ARCHITECTS, BUILDERS, and OTHERS.—The Penarth Harbour, Dock, and Railway Company are prepared to receive PLANS, DESIGNS, ESTIMATES, and SPECIFICATIONS, for an HOTEL, a Dock-master's House, a Dock Office, a Custom House and Ten Merchants' Offices, to be erected at Penarth. The Company will pay a premium of 50l. for the plans and designs which shall be considered by the Company to be best, and a reward for the next and further particulars obtained on application to the Company's Secretary, at the Penarth Harbour Office. Plans and designs to be sent in addressed to the Directors, on or before the end of FEBRUARY, 1864.—By order of the Board,

BOOTH BACON, Secretary.

Company's Office, near Cardiff, January 27th, 1864.

FIFTY POUNDS PRIZE for Improved VERMIN TRAP.—The Committee of the Royal Society for the Prevention of Cruelty to Animals offer a Prize of 50l. for a TRAP, which shall either, without inflicting torture, secure vermin alive, or instantaneously destroy them. The invention must be simple, inexpensive, certain, and fit for use in game preserves. The Committee, assisted by scientific persons, will be the judges, and the reward will be given to the best trap, provided in their judgment it is efficient for the purpose required.—For further particulars, apply to

13, Pall-Mall, S.W. JOHN COLAM, Secretary.

P.S.—Several country gentlemen and masters of hounds have contributed in support of the above project. Suggestions from sportsmen and game preservers are earnestly desired.

TO SCULPTORS.—The COUNCIL of the ART-UNION of LONDON request that every sculptor intending to COMPETE for the PREMIUM of 600l. offered by the Society, will send to the Office, on or before the 8th of FEBRUARY next, a sealed letter, containing his name and address, and bearing on the outside the title of the work he proposes to send in, and a motto or mark which must also be repeated on the work. This is asked in order that sufficient accommodation for the models may be provided. Due notice will be given by advertisement of the place to which the works are to be sent on the 1st of MARCH next.

GEORGE GODWIN, } Hon
LEWIS POCOCK, } Secretaries

14 West Strand, 23rd January, 1864.

[For Contracts see next Page.]

CONTRACTS.

TO PAINTERS, GLAZIERS, GRAINERS, STONEMASONS and OTHERS to BE LET by CONTRACT, the FINISHING of an ELEVEN ROOMED HOUSE. Specifications to be seen on the premises.—Apply to Mr. GALE, Gale-terrace, Catcliffe-lane. All the repointing, altering, and fixing of seven marble chimney-pieces.

TO BUILDERS and CONTRACTORS.—TENDERS are required for the NEW BUILDINGS (covering nearly half an acre of ground) to be erected on the site of Argyll House, Argyll-street, Oxford Circus. Also for the Old Materials of the existing Premises. Plans, specification, and particulars, can be seen on or after the 27th instant, at Messrs. HAIG'S Office, No. 13a, Fenchurch-street; or at Argyll House.—Tenders to be delivered at No. 13a, Fenchurch-street, by NOON on the 26th FEBRUARY next, but Messrs. HAIG do not bind themselves to accept the lowest or any Tender.

TO PAVIORS, CONTRACTORS, and OTHERS.—Notice is hereby given, that the Fareham Local Board of Health invite TENDERS from Persons willing to CONTRACT for PROVIDING and LAYING in the town of Fareham, for the paving of footways at the rate of superficial yards of 6 inch PENRYN BEKKERING, in the best manner of such kind of work, and fixing of GRANITE KERBING. Copies of the specification and form of Tender, with full particulars, can be had on application to Mr. THOMAS BUCKHAM, C.E. Engineer to the Board, at his Office, Quay-street, Fareham. Tenders, endorsed "Tenders for Paving," to be forwarded to R. PORTER, Esq. Chairman of the Local Board of Health, Fareham, on or before THURSDAY, the 11th day of FEBRUARY, 1864. The Board do not bind themselves to accept the lowest or any Tender.

ALFRED DRIVER, Clerk.

Fareham, January 25, 1864.

EXETER IMPROVEMENT ACT.—The Commissioners of Improvement for the City of Exeter are desirous of receiving TENDERS for LAYING DOWN some new FLAGGING in parts of the High-street of the City, to the extent of about 8 feet superficial feet. The flags must be from the quarries in the neighbourhood of Bradford or Buttas, Yorkshire. The specifications for the work required can be obtained on application at my Office. The Commissioners do not pledge themselves to accept the lowest or any Tender. Tenders to be delivered at the office of Mr. WM. BUCKINGHAM, Clerk to the Commissioners, 12, Bedford-place, Exeter, on or before the 5th of FEBRUARY next.

THOS. WHITAKER, City Surveyor.

Dated, Margrave's alley, Exeter, 9th January, 1864.

TO BUILDERS and OTHERS.—TENDERS are required for the ERECTION of STABLING at the rear of the Wickham Arms Tavern, Brockley-road New-cross for Messrs. COURAGE & CO.—For particulars, apply to Mr. JENKINS, Surveyor, 1, Mount Pleasant-place, Lewisham-road. Messrs. COURAGE & CO. do not bind themselves to accept the lowest or any Tender. All Tenders must be sealed up, and addressed to Messrs. COURAGE & CO. and deposited with Mr. JENKINS, not later than the 13th FEBRUARY next.

TO BUILDERS.—CONTRACT for STATION BUILDINGS and COTTAGES at CROYDON.—The Directors of the London, Brighton, and South Coast Railway Company are ready to receive TENDERS for the necessary WORKS in ERECTING STATION BUILDINGS in the Selhurst road, Croydon, on the line of railway from Croydon to Redhill, and for the Erection of Twelve Cottages, also in the parish of Croydon. Drawings and specification may be seen at the Office of the Resident Engineer, London Bridge Terminus; and Tenders, in the prescribed form, must be sent to the Secretary, on or before MONDAY, the 8th FEBRUARY next. The Directors do not bind themselves to accept the lowest or any Tender.

London Bridge Terminus, January 26, 1864.

TO MANUFACTURERS of SEWER and DRAIN PIPES, BRICKMAKERS, and OTHERS. The Local Board of the District of Ormskirk, in the County of Lancaster, are prepared to receive TENDERS for the SUPPLY of SEWER and DRAIN PIPES, INVERTS, and RADIATE BRICKS, required for the sewerage works of the said district. The estimated quantity of pipes required is 8,000 yards. The specification and conditions may be seen and forms of Tender and necessary information obtained on application to Mr. BRIERLEY, Civil Engineer, Blackburn.—Sealed on application to Mr. BRIERLEY, Civil Engineer, Blackburn.—Sealed Tenders, endorsed "Tender for Sewer Pipes," must be sent to my Office, No. 2, Hall-lane, Wigan, on or before SATURDAY, the 6th day of FEBRUARY next.

JOHN PICKOP, Law Clerk.

January 27, 1864.

TO BUILDERS.—TENDERS are required for the ERECTION of a PAIR of SMALL VILLAS, on the Addiscombe Estate, for Mr. G. Mathews. The drawings and specification can be seen at the Crown Hotel, Croydon, until TUESDAY, 9th FEBRUARY, on which day Tenders are to be delivered.

HENRY BANCE, Architect and Surveyor.

Croydon, January 28, 1864.

CONTRACTS, 1864.—PARISH of ST. GEORGE, HANOVER-SQUARE.—Such Persons as are willing to CONTRACT with the Vestry of the said Parish for the following WORKS and MATERIALS, for One Year, from the 25th day of March, 1864, viz.:—

Supply of Paints and Oils,
Supply of Guernsey Granite,
Purchase of the Manure and Ashes,
Carting away the Slop and Sweepings of the Streets,
Furnishing Carts and Horses for Day work,
Spreading Water in the Streets,
Masons' Works,
Paviors' Works,
Supply of Paving Materials,
Supply of Thames Ballast, Sand, and Hogging,
Supply of Workmen's Tools and Hammers for Stone-breaking, and Repairs of the same,
Smiths' Works,
Gasfitters' Works,
Supply of Bass Brooms,
Drain Pipes,
Shoeing of the Horses,
Veterinary Cure of Horses;

may deliver in PROPOSALS, sealed up, at the Office of the Boardroom, Mount-street, Grosvenor-square, on or before NOON, on Monday, 15th February, 1864, and attend at the Vestry-room, Parish-buildings, on or before SATURDAY the 13th of FEBRUARY, 1864. Persons tendering are hereby further notified that all Proposals must be made up in, and strictly in accordance with, the printed forms of Tender, to be obtained at the above Offices.—Further particulars may be obtained on application to Mr. E. C. BICKHAM, Surveyor, at the Office, 1, Bow-street, any morning between the hours of NINE and ELEVEN o'clock. Contracts to be prepared by the parish solicitors, at the expense of the Contractors; and the Vestry do not bind themselves to accept the lowest or any Tender. By order,

JOSEPH HENRY SMITH, Clerk to the Vestry

TO BUILDERS and OTHERS.—The Directors of the Commonwealth Land, Building, and Investment Society are prepared to receive TENDERS for the ERECTION of a Pair of Semi-detached COTTAGES, on Lots 12 and 13 in Block 4 on the Ascot Estate, fronting the railway station. Plans and specifications are prepared, and may be obtained upon application to Mr. JACKSON, Manager, at the Offices of the Society, No. 31, Assembly-row, Mile-end-road. Tenders to be delivered on MONDAY, the 8th day of FEBRUARY; but the Directors do not bind themselves to accept the lowest or any Tender.

TO BUILDERS.—Persons desirous of TENDERING for the ERECTION of a New BANK and PREMISES for the London and County Bank, with HOUSE adjoining, at Newbury, Berks, are desired to inspect the plans and specification on and after MONDAY, the 15th of FEBRUARY next, at the London and County Bank, Newbury, or at the Offices of the Architect, Mr. FRED. CHANCELLOR, Palmer's-road, Old Broad-street, London. The Tenders to be delivered at the London and County Bank, Lombard-street, London, before TWELVE o'clock on MONDAY, the 29th of FEBRUARY. The lowest or any Tender will not necessarily be accepted.

BOGNOR RAILWAY.—To CONTRACTORS and BUILDERS. The Directors of the Bognor Railway Company are prepared to receive TENDERS for the ERECTION of the BOOKING OFFICES, Waiting Rooms, Platform, Goods Shed, Weighing Machine, and other Buildings required at the Terminus Station at Bognor, in the county of Sussex. Drawings and specification may be seen for inspection at the Office of the Engineer, Mr. JACOMB HOOD, 5, Little George-street, Westminster, S.W. and Tenders on and after MONDAY, the 1st of FEBRUARY next, and Tenders must be delivered to the undersigned, at the London Bridge Terminus, not later than TWELVE at NOON on TUESDAY, the 16th of FEBRUARY.

N.B. The Directors will not be bound to accept the lowest or any Tender.

FREDERICK SLIGHT, Secretary.

London Bridge Terminus, January 22, 1864.

TO CONTRACTORS, PIPE MAKERS, EXCAVATORS, BUILDERS, and OTHERS.—LOCAL BOARD of HEALTH STANFORD-LE-HOPE and WEST THURROCK.—Notice is hereby given that on WEDNESDAY the 10th day of FEBRUARY next, and not after that day, Plans, Specifications, and Forms of Contract, for the DRAINAGE WORKS of Stanford, will be submitted, at the Office of the Surveyor to the Board, at Shanklin, to the inspection of those persons desirous of TENDERING for the EXECUTION of the same—Sealed Tenders to be addressed to the Chairman of the Shanklin Local Board, and to be delivered at his residence, in East Cliff road, Shanklin, on or before the 16th day of FEBRUARY next. The Board do not bind themselves to accept the lowest or any Tender.

25th January, 1864.

TORQUAY.—To BUILDERS.—Persons desirous of submitting TENDERS for the ERECTION of FOUR HOUSES in Ellacombe-street, Torquay, can inspect the drawings and specifications at my Office on and after TUESDAY, the 9th of FEBRUARY. The Tenders must be delivered at my Office on or before the 16th of FEBRUARY. The lowest or any Tender will not necessarily be accepted.

EDWARD APPLETON, F.I.B.A. Architect.

Torquay, January 27, 1864.

GREAT HARWOOD LOCAL BOARD of HEALTH.—To EARTHENWARE SEWER-PIPE MANUFACTURERS.—The Local Board of Health of the District of Great Harwood desire to receive TENDERS for the SUPPLY of EARTHENWARE SEWER and DRAIN PIPES required for the purposes of their District. Quantity required about 1,000 yards. The specification, and conditions may be seen, and forms of Tender and necessary particulars obtained, by application to Mr. BRIERLEY, Civil Engineer, Blackburn. Sealed Tenders, endorsed "Tender for Sewer Pipes," &c. may be sent to the undersigned, at his Office in Rockburn, not later than SATURDAY, the 6th day of FEBRUARY, 1864.

THOS. CLOUGH, Law Clerk to the said Local Board.

Blackburn, 27th January, 1864.

TO BUILDERS.—The Guardians of the Poor for the Union of Pontypridd, in the county of Glamorgan, are desirous of receiving TENDERS for the ERECTION of a WORK HOUSE, and Offices connected therewith. Plans, specifications, &c. may be seen at my Office, and Bills of Quantities obtained. Tenders to be sent to E. C. SPICKETT, Esq. Clerk to the Board, Pontypridd, endorsed "Tender for Workhouse," on or before the 1st day of MARCH next. The Board do not bind themselves to accept the lowest or any Tender. Each Builder will be required to give in with his Tender the names of two sureties, who will be held responsible for the fulfilment of his Contract.—By order of the Board,

GEO. E. ROBINSON, Architect.

Cardiff, January 26th, 1864.

LANCASHIRE and YORKSHIRE RAILWAY.—The Directors are prepared to receive TENDERS for the CONSTRUCTION of a BRANCH RAILWAY from Bacup to Meltham, about 4½ miles.—Plans and specifications may be seen and forms of Tender obtained at the Engineer's Office, Hunt's Bank, Manchester, on and after MONDAY, the 8th JANUARY instant, and Tenders, properly endorsed and addressed to the Directors, must be in the hands of the Secretary not later than MONDAY, the 15th FEBRUARY, 1864.

WM. S. LAWN, Secretary

Manchester, December 19, 1863.

METROPOLITAN IMPROVEMENTS. SOUTHWARK STREET.—The Metropolitan Board of Works hereby give notice, that they will receive TENDERS for the Sewerage, Paving, Channelling, &c. on WEDNESDAY, the 2nd MARCH, now next, at TWELVE o'clock at Noon precisely, and will be prepared to open TENDERS by parties then present, for the WORKS and BUILDING LEASES of the Portion of certain LOTS of GROUND, situate on the North and South sides of Southwark-street from High-street, Borough, to Blackfriars road, Surrey, and for the formation and form of Tender, and such information may be obtained in the Superintending Architect's Office, at the Office of the Board, on and after the 1st of FEBRUARY next, between the hours of NINE a.m. and FOUR p.m. The Tenders must be on the printed form supplied at the Office of the Board, and be delivered under sealed covers, endorsed "Tender for Southwark-street," and addressed to the Clerk of the Board, at the Office of the Metropolitan Board of Works, Spring-gardens, S.W. before TWELVE o'clock at noon, on the said 2nd MARCH next, and no Tender will be received after that hour. The Board do not bind themselves to accept the highest or any Tender.

JOHN POLLARD, Clerk of the Board.

Spring-gardens, Charing-cross, 25th January, 1864.

TO BUILDERS.—Such Persons as may be desirous of UNDERTAKING the several WORKS and REPAIRS that may be required by the War Department to the BARRACKS at Chichester, from the 16th MARCH, 1864, to the 31st MARCH, 1865, may be furnished, by payment of seven shillings and a penny, with the printed Forms of Tender, Conditions of Contract on personal application at this Office, between the hours of TEN and FOUR daily (Sundays excepted), up to the 10th FEBRUARY next.

The Tenders to be delivered before TWELVE o'clock at noon on SATURDAY, the 13th day of FEBRUARY, 1864, at the War Office, Pall Mall, London, addressed to the Director of Contracts, and endorsed "Tender for Artificers' Work, Chichester."

The Secretary of State for War reserves to himself the right of rejecting the whole or any of the Tenders.

J. W. GORDON, Colonel,
Commanding Royal Engineer.

Royal Engineer Office, Portsmouth, 17th Jan. 1864.

NORTH EASTERN RAILWAY.—DARLINGTON SECTION.—The Directors are prepared to receive TENDERS for the following Works, viz.:—ALTERATIONS and ADDITIONS to DARLINGTON STATION, consisting of Brick and Masons' Work, in altering and extending the Platforms and Offices, repairing and altering Timber and Slater's Work, in Roofs and Offices; and a large quantity of Ironfounder and Glazier's Work, in covering Extension Platforms. PATENT WORCESTERSHIRE RANGE.

PRIZE MEDAL 1862, AWARDED FOR EXCELLENCE.

The above RANGE is most complete, and strongly recommended for its unrivalled ECONOMY, CLEANLINESS, CONVENIENCE, DURABILITY, and is a certain CURE for SMOKY CHIMNEYS.

It is an entirely new invention, and consists of JOINT MEAT ROASTER, PASTRY OVEN, and WROUGHT IRON BOILER. The top forms a HOT PLATE for BOILING, STEWING, &c. The whole heated by ONE SMALL FIRE. One 3 feet wide is equal to an ordinary Range 8 feet wide.

Extracted from the "London Daily Telegraph," May 19th, 1862.

"INTERNATIONAL EXHIBITION, CLASS II.

"Of the most recent inventions it should be said that Messrs. JONES & ROWE'S Patent Worcestershire Range has attracted very special attention, and has been commended by the best authorities. A valuable peculiarity of their Range is the glazing of the OVEN and ROASTER one above the other instead of *side* by *side*; and the ROASTER is constantly replenished with fresh air."

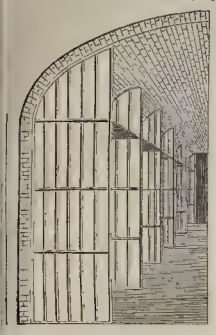
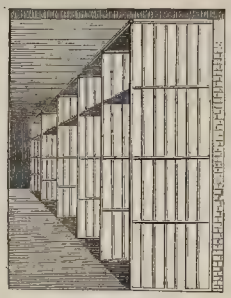
Manufactory, 190, High Holborn, London.
Drawings and Estimates furnished.



RICKETT'S & HAMMOND'S
VENTILATING GLOBE LIGHT,
combining an agreeable method of lighting, with convenient, simple, and efficient ventilation.



The advantages of this fixture are these:—
A TOTAL REMOVAL OF ALL PRODUCTS OF COMBUSTION.
A COMPLETE DISPLACEMENT OF HEATED AND VITIATED AIR.
AND A CONSIDERABLE ECONOMY IN THE CONSUMPTION OF GAS.
A GLOBE LIGHT will consume 5 to 7 feet of gas per hour, giving as much light as an ordinary three-light chandelier, with a consumption of 15 feet per hour.
No. 5, CHANDOS STREET, CHARING CROSS, LONDON, W.C.

TO IRONMONGERS, BUILDERS, &c.
PATENT WROUGHT-IRON WELDED
TUBE for GAS; Galvanized ditto, for Water; High-pressure Cocks, &c. Manufacturers of Dr. Arnott's Improved Ventilators.
HULETT & CO. 55 High Holborn.

WROUGHT IRON WINE BINS.

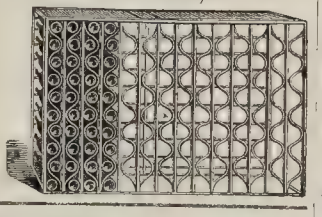
FARROW & JACKSON

Beg to call the attention of Architects and Builders to their Wrought Iron Wine Bins, which are ADAPTED (as shown) either for BRICK ARCHED VAULTS or CELLARS with FLAT CEILINGS, the mode of fixing in either case being so simple, that they may be put up by any ordinary workman. They combine great strength with lightness and economy of space, and their DURABILITY has been satisfactorily PROVED DURING nearly FORTY YEARS.

The Shelves are formed of Plates of Iron laid on Bars, which rest on the Cross-bars of the Lattice Uprights, and are removable at pleasure.

Plans and Estimates furnished, and Cellars fitted complete in any part of the Kingdom.

*** As these Bins were the invention of the late Mr. FARROW, and great attention has been given to them by the present Firm, long practical experience enables FARROW & JACKSON to offer the best advice as to arrangement.



ALSO THEIR

NEW REGISTERED IRON BINS,

Made any size or shape, to fit any spare corner, with SEPARATE REST FOR EACH BOTTLE,

Peculiarly adapted for Private Cellars.

No laths are required, and all trouble of Binning is avoided. The Cellular Bins may also be had fitted with light lattice doors, affording perfect security to the contents of the Bin.

ESTABLISHED 1744.

AUSTIN'S IMPERIAL PATENT SASH

and BLIND LINES.

To BUILDERS, CARPENTERS, and BLIND MAKERS.

J. AUSTIN, Manufacturer of the above articles, particularly wishes to direct the attention of the Trade to his

IMPERIAL PATENT FLAX SASH-LINES,

of which he is now making four qualities, and he strongly recommends that in all cases they should be purchased in preference to the PATENT LINES made from Jute, which article has neither the STRENGTH nor DURABILITY of Flax, consequently cannot give so much satisfaction to the consumer.

They can be obtained of all Ropemakers, Ironmongers, Merchants, Factors, and Wholesale Houses, in Town and Country.

STAMP END WORKS, LINCOLN; AND 78, LOMBARD STREET, LONDON.

Descriptive, Illustrated, and Priced Catalogues, Free per Post.

THE DENNETT ARCH.

Allowed to be the cheapest fireproof construction known, and used with the greatest success for the last ten years in the Midland Counties, and has been adopted by G. G. Scott, esq. for the New Foreign Offices used in any form of arch, ground or dome; turned to any length, width, or height, forming a perfect floor and ceiling in one piece, from 24 inches in the crown to any required thickness.

Address to the Patentees,—A. & R. DENNETT & CO. NOTTINGHAM.

TESTIMONIAL.—"I have made use of Messrs. Dennett & Co.'s material for Fireproof Arching, and though I have, happily, had no practical experience of its efficiency as against fire, I can bear witness to its strength, and its extreme facility of application. I have made use of it in positions in which I should have found it difficult to introduce any other description of material, and it has this advantage, that the arches constructed of it are entirely in one mass that they cover the space like a compact shell or inverted beam, and are, consequently, almost wholly free from lateral pressure.

"GEO. GILBERT SCOTT, 20, Spring Gardens, London."

BUILDINGS AND SHIPS EFFECTUALLY SECURED AGAINST LIGHTNING.

PATENT LIGHTNING CONDUCTORS,

according to the system of Sir Snow Harris, F.R.S. as now universally adopted in every department of the Public Service, supplied and carefully fitted in every detail, under the immediate instructions of Sir Snow Harris, by G. W. GRAY, who has effectually secured a large number of ships, public buildings, and magazines against the destructive agency of lightning, including the Houses of Parliament, magazines, afloat and on shore, of the War Department and many churches and other important structures. Buildings surveyed, and plans and estimates submitted, if called for.

J. W. GRAY & SON, 114, Fenchurch-street, E.C.

LIGHTNING CONDUCTORS.

R. S. NEWALL & CO. Patentees of the COPPER ROPE LIGHTNING CONDUCTOR, supply the same, with the point and all staples, complete for fixing, at the following prices:—

Three-eighths inch diameter	1s. 6d. per foot.
Half-inch diameter	1s. 6d. "
Five-eighths inch diameter	2s. 0d. "

R. S. Newall & Co.'s Patent Copper Rope Lightning Conductor is being applied by architects, engineers, and scientific men, in all parts of the world.

Offices—130, Strand, London.
" Gateshead-on-Tyne

PATENT LOUVRE CHIMNEY CAP,

which has been in use some time with perfect success, many curing chimneys where other caps have been found to fail.

The advantages attending this Cap are—it can be thoroughly cleaned by the machine when the chimney is swept, the brush being able to pass through the Cap without the liability of misplacing it; an increased up current, and the impossibility of a down one.

Prospectus, with testimonials, forwarded on receipt of Postage Stamp, by

S. DEACON,

59, ALMA STREET, HOXTON, N.

MANUFACTORY

HEMSWORTH STREET, SAINT JOHN'S ROAD, HOXTON, LONDON, N.

ROBERT MACLAREN & CO.

EGLINTON FOUNDRY, GLASGOW,

Manufacturers of a Series of CAST-IRON MAIN PIPES, for Gas or Water, on an IMPROVED PATENT.

GENERAL IRON FOUNDERS, GAS ENGINEERS, and WROUGHT IRON TUBE MAKERS

RYFFEL'S PATENT HYGEIAN STOVE, heated either by coal or gas. With one penny-worth of coal this Stove affords for twenty-four hours a genial, healthy, and uniform temperature, free from any smell or decomposition of the air. It was favourably noticed in the "The Lancet" of February 1st, 1862, and recommended as the only stove particularly suitable for the bed or sick room.—For particulars apply to the Depôt, where the stove is sold and may be seen in action.

RYFFEL BROTHERS,

5, Upper Stamford-street, Blackfriars, London.

GARDNER'S SUNLIGHT GAS BURNER and FITTING ESTIMATES

Offer important advantages to Architects, Builders, and the Public generally.—GARDNER'S, No. 453, Strand, Charing-cross, four door from Trafalgar-square, London.

ESTABLISHED 1752.

THOMAS TURTON & SONS,

MANUFACTURERS OF

CAST STEEL for Cutters, Punches, Taps and Dies, Turning Tools, Chisels, &c.

CAST STEEL Piston Rods, Crank Pins, Connecting Rods, Straight and Crank Axles, Shafts, and Forgings of every description.

FILES marked T. TURTON, Superior to any other make.

(See results of trial in the *Times*, July 26th, 1851.)

TOOLS of all kinds, for Engineers, Railways, Contractors, &c. &c.

EDGE TOOLS marked WM. GREAVES & SONS. Electro Borassic Steel, warranted to wear out three Tools made of Cast Steel.

DOUBLE SHEAR STEEL, | SPRING STEEL,
BLISTER STEEL, | GERMAN STEEL,
SPRINGS, BUFFERS, AND CAST STEEL TYRES,

For Locomotive Engines, Railway Carriages, and Waggons.

SHEAF WORKS and SPRING WORKS, SHEFFIELD.

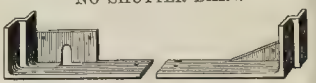
SEVERAL DESKS IN STOCK.

CONTRACTORS FOR ROOFING THE GREAT EXHIBITION BUILDING OF 1862.

By Her Majesty's Royal Letters Patent.



F. McNEILL & CO. of LAMB'S BUILDINGS, BUNHILL ROW, LONDON,
Manufacturers and ONLY Patentees of
THE PATENT ASPHALTED FELT, FOR ROOFING HOUSES, VERANDAHS, SHEDS, &c.
Patronized by
HER MAJESTY'S WOODS AND FORESTS,
HER MAJESTY'S COMMISSIONERS OF CUSTOMS,
HONOURABLE EAST INDIA COMPANY,
HER MAJESTY'S WAR DEPARTMENT,
HER MAJESTY'S ESTATE, ISLE OF WIGHT,
ROYAL BOTANICAL GARDENS, REGENT'S PARK.

And by the most eminent men of the Royal Agricultural Societies of England, Scotland, and Ireland, at whose great national shows it has been exhibited, and OBTAINED THE PRIZE, for being the best and cheapest article for roofing; also used for under slates at the Royal Agricultural Society's Houses in Hanover Square. Its advantages are lightness, warmth, durability, and economy. It is impervious to rain, snow, and frost, and a bad conductor of heat and sound. The Felt can be cut to any length, by 32 inches wide. The price is only ONE PENNY PER SQUARE FOOT. Samples, with full directions as to its uses, and the quantity of nails required, sent free to any part of the town or country. DRY HAIR FELT, for covering Boilers, &c. is also manufactured, by which a saving of about 25 per cent. in fuel is effected. The TRADE are respectfully enjoined to send their orders DIRECT to the FACTORY, as the surest means of being supplied with a good article, and at the lowest cost suited to their trade. The original works were the above roofing is made are F. McNEILL & CO.'S Manufactories, LAMB'S BUILDINGS, BUNHILL ROW. Roofs covered with McNEILL'S FELT to be seen at the CAMPS of ALDERSHOTT, CURRAGH, SHORNCLIFFE, and COLCHESTER, upwards of Three Millions of Feet, also the GREAT EXHIBITION BUILDING of 1862 of nearly One Million Feet. A Liberal Discount allowed to the Trade.

CHRISTMAS PARTIES.

JOHN EDGINGTON & CO.'S WATER-PROOF TEMPORARY ROOMS, comfortably warmed, floored lighted, and elegantly decorated. Easily erected and removed to any distance. Observe the address, JOHN EDGINGTON & CO. 48, Long lane, Smithfield, E.C. and 18, Piccadilly, W. Manufactory, 108, Old Kent-road, S.E.

NO SHUTTER BARS.

JENNINGS'S SHOP-SHUTTER SHOE.

SHOP SHUTTERS are SHOD and SECURED by the above at HALF THE COST OF THE UNSIGHTLY AND DESTRUCTIVE SHUTTER BAR. Shops referred to in every public street in London. When ordering the above, send FINISHED THICKNESS of Shutters, and the way they go up.
Sold by all Ironmongers, and the Inventor,
GEORGE JENNINGS,
Engineering Depot, Palace Wharf, Stangate, Lambeth S.

HUBBUCK'S PATENT WHITE ZINC PAINT.

By their process, which is patented, pure Zinc Paint is Cheaper than White Lead. It does not change colour with the London atmosphere.

ADULTERATIONS.—Some Paint Grinders have been selling Zinc Paint adulterated with Sulphate of Barytes from ten to thirty per cent. White sold under the name of "Improved Zinc Paint," or as the number Two or Three qualities, no workman can produce good work with such material. Workmen who have once used the Patent Zinc Paint will never willingly use any other Paint for their best work.

CHEAPNESS.—Not only is it cheaper per hundred weight, but two hundred weight of this Paint, with six gallons of oil covers as much surface as three hundred weight of white lead and twelve gallons of oil.

EACH CASK IS STAMPED "HUBBUCK, LONDON, PATENT."

THOMAS HUBBUCK & SON,
WHITE LEAD, OIL, PAINT, AND VARNISH WORKS, 24, LIME STREET, LONDON.

VENTILATION—PURE AIR.

THROUGH THE EXTERNAL WALL.

These Ventilators are arranged so that the requisite quantity of air may be admitted for the due ventilation of an apartment without the slightest draught being felt by the occupants; and as they are placed in the external wall, their action is not impeded when the house is closed for the evening, at which time a constant supply of fresh air is most required.—HAYWARD, BROTHERS, sole Manufacturers, 187 and 189 (late 117 and 118), Union-street, Borough, London.

The Builder.

VOL. XXII.—No. 1095.

"Going Along:" Turin and Italian Lakes.

SIGHT-SEEING is naturally the order of the day, and we rush off at once to the more prominent and best known Lions yet unvisited in Turin, nearly all of them, luckily, pretty close together. Pity the poor foreigner, in a parenthesis, who wishes to do the same thing in London in a short time,—who, putting up say at the Victoria Hotel, starts to get a peep at the Thames Tunnel and the South Kensington collections, and perhaps dip into the British Museum, northward, between the two. In Turin, however, things lie together. In the Royal Palace, there are some modern pictures, amongst which may be specially mentioned the Judgment of Solomon, by Podesti (very good, particularly the figure of the real mother); "Frederic Barbarossa at the Siege of Alexandria," by Arienti; and the charming portrait of the young Duchess of Burgundy in her red-velvet, gold-laced walking-dress, with powdered hair, and hat in her hand. There is a handsome suite of reception-rooms, elaborately gilt; and the throne-room has a fine parquetted floor. Many other points of interest present themselves in the Royal apartments here, which since the death of the Queen and the Queen-Mother have not been used,—the *Salle de Reception*, for example, where the Princess Clotilde was asked in marriage for the Prince Napoleon, and the Princess Pia for the King of Portugal; two excellent busts of these princesses, by Santovarini, of Genoa; the chandeliers of rock crystal, on frames of finely-worked steel; and the lift, or descending-room, constructed beyond the external wall, to lower the Queen-Mother from her apartments to the gardens, to spare her fatigue.

In the museum, connected with the palace, we find the very interesting and well-known collection of armour and arms, the *Armeria di Carlo Alberti*, including many fine equestrian suits admirably mounted on well-modelled horses covered with skins from the Royal stable. By a little confusion of recollections, easily understood, this peculiarity was attributed to the horses in the Ambras Museum, Vienna, in our description of that admirable collection. It belongs, however, exclusively to those in the Turin collection. There is one horse in especial, a cream, quite lifelike, and carrying a graceful rider,—the whole a perfect specimen of the manner in which equestrian suits should be displayed. We are again led to think with little satisfaction of our armoury in the Tower at home, which ought to be the finest collection of the kind in the world, and might be soon made so under proper direction. In the Turin collection there are two or three suits of the fifteenth century, more than usually well wrought and gilt; some excellent swords and breastplates; and the arms given to Philibert Emanuel by Charles V. of Spain, finely worked on ivory and in metal. One suit, noticeable for its very large size, is powdered with a coronet, the letter F, and the pentacle,

Amongst the curiosities and caprices is a winged Burgonet taking the shape of the winged head of an animal with fangs, and yet not unlike an ugly sort of flying fish. This is a recent addition from Germany, purchased by the present *Re Galantuomo*; and a genuine specimen, which is more than can be said of some winged burgonets we know of. The attendant insists on its belonging to the eighth or ninth century; but that is simply nonsense. It is probably not earlier than the time of Maximillian and our Henry VII. or VIII.

The Museum of Antiquities includes some remarkable Egyptian monuments and relics, and a tablet in honour of Champollion, who studied there.

The Royal Gallery of Painting gives us about 610 works, many of them excellent specimens. As a whole, the collection is much better than we had been led to expect, and in some points stands alone. Here, for example, may best be made a right estimate of the talent of Gaudenzio Ferrari, a painter who is much less esteemed in England than he should be. He was the pupil of Bernardino Luini, who had his inspiration, it will be remembered, from Da Vinci; and Gaudenzio, next to Luini, is the greatest of the Milanese masters. He had been a pupil of Perugino also, and at that time had made Raffaelle his friend, whom he helped about the year 1517 in painting some of the apartments in the Vatican. Gaudenzio died in 1549, and yet waits for a full appreciation.

Of the work of Paulo Veronese there are some excellent specimens, particularly "The Magdalen in the House of Simon the Pharisee," a grand picture in the most perfect state of preservation. The head of the Saviour is not the best part of the picture;—a circumstance not uncommon in similar subjects.

Rembrandt's "Portrait of a Rabbi" (that with lights on the table: there are two so entitled) is one of the finest of his works, and seizes the spectator by the eyelids: a very different affair from much of the rubbish in the world said to be by the Leyden master. Holbein's "Portrait of Calvin" is another speaking head. His portrait of Martin Luther, dated 1542, is a less agreeable picture; and, moreover, is not so well painted. The portrait of Pope Paul III., attributed to Titian, is a marvellously good head, with fine old hands. A "Portrait of a Man," grave and grand, under the same painter's name, admits of less doubt as to its authenticity. The gallery is strong in Guercinos (he lived from 1591 to 1666): especially beautiful is his "Virgin and Infant Jesus."

Many English visitors, when looking at two pictures hung together, and titled, "Portrait of a Man," and "Portrait of a Woman," both by Ravestein, portraits most delicately and carefully painted, have said,—and who is Ravestein? Jean Van Ravestein was born at the Hague about the year 1580, and lived until he was seventy-five. He was one of the best portrait-painters of the Dutch school, and that is saying something. There is a third picture by him in the Turin gallery, a "Portrait of a Princess," remarkably delicate. One of Memling's masterpieces is here, sometimes called "The Seven Griefs of Mary," but more properly in the catalogue, "The Passion of Jesus Christ." It is perhaps inferior to the "Seven Joys," at Munich, as we said when speaking of the latter, but is, nevertheless, a picture the sight of which is worth the journey from London. If that inducement, however, should not be sufficient, add to it the Vandyck portraits of the Princes of Savoy and of the children of Charles I., and all doubt will be removed.

There is a remarkable picture of "Cows in a Prairie," signed *Paulus Potter*, 1649; for which they say Charles-Albert refused a Raffaelle offered by the Grand Duke of Tuscany. The only picture in the collection seriously attributed to Raffaelle is one known as the *Madonna della Tenda*, from the character of the background. Some strong opinions have been given in favour of its authenticity, but it will never be received undoubtingly by all, though it be quite certain that Charles-Albert paid 3,000*l.* for it. The colour is brick-dusty, and portions of the picture, at any rate, are the work of a poor hand.

Pictures by Albert Durer, Rubens, Mantegna and others, come back to recollection, but we may not venture to dwell upon them; though we could willingly loiter in the rooms all day. High is the enjoyment, great the advantage to be found in a fine gallery of art. Art?—

> "Say what is Art? Th'acquirement of a sense
> Discoverable, dormant, incomplete—
> Poetry, Painting, Music; do they cheat
> The understanding with false ravishments
> Of things that are not? No: when man invents
> He but discovers; and with favour'd feet
> Walks privileged where angels pass and meet,
> And bringeth back, as 'twere, the rudiments
> Of their high language."

Leaving this mental trysting-place we go where *mortals* "pass and meet,"—to the Chamber of Deputies, the outside displaying a rough kind of cut brickwork, very curious to the sight; and afterwards to the Upper House. Off went our companion's hat, and justly, to the memory of one whose seat, not very long vacant, was pointed out. Camille de Cavour will long live in the hearts of his countrymen: his name will go down to posterity as that of a true patriot and a wise man. Nice and Savoy threw a stain upon his memory; but time, which gives more complete knowledge of events, is rapidly effacing it. A tablet distinguishes the house wherein he dwelt. If Cavour had lived, Italy by this day would have had less to strive for. The good time, however, is but delayed,—

> "Freedom's battle once begun,
> Bequeath'd from bleeding sire to son,
> Though baffled oft, is ever won."

The Chamber of Deputies, we may go back to say, is semicircular in plan, and has 500 seats for 444 members, who all speak, as in our own House of Commons, from their places, not from a tribune.

And now Turin, with its arcaded walks and back-ground of mountains (the Superga basilica on one of them four or five miles away); its university, its academy, its sprinkling of statues, the pleasant river, and active people, must be left. Our faces are set towards the Lago Maggiore, so we turn upon our footsteps; again use the railway back to Novara, and thence by another line go northwards, to Arona, at the foot of the lake. Let us first note, however, as to the river on which Turin stands, once called the Bodinco, or bottomless, and now the Po, what Eustace points out, that in its course, which, including its windings, extends to three hundred miles, it receives thirty rivers, bathes the walls of fifty towns and cities, and gives life, fertility, and opulence to extensive plains. Truly a good river.

The view of the Alps, on one side, going away from Turin, as many of our readers will recollect, is superb. The peaks, covered with snow, stand out in the pure air bright and clear, against a blue sky; while on the other side are seen the less rugged Apennines, covered with trees and herbage. It was an exquisite morning—everything smiled. Add to this a row on the lake in the evening, with a first view of Monte Rosa, Europe's second mountain, high upreared behind the nearer hills in a pale yellow sky, with, later in the night, the moon and a myriad of stars in the sky,—our one boat the only moving thing over the expanse of placid and illumined water,—and it becomes a day of sensations to be long remembered.

By sunlight the prominent object at this end of the lake is the colossal statue of the good Carlo Borromeo, built up of metal plates on a lofty stone pedestal, high on a mountain. A minute description of it was given in the *Builder* a few years ago. Suffice it now to say, to convey a notion of its size, that the head will hold

five persons, and that a man can walk upright within the outstretched arm. The stone-work of the pedestal is in a bad state, for want of pointing: and a house or two that have been recently built near it mix up awkwardly with the statue from several points of view, and spoil the effect of it. Some supervision by those in authority should be exercised in such respects.

The characteristics of the Lago Maggiore, its lofty banks covered with trees, detached residences, hamlets, and villages, embellished with flowers, and backed up by mighty mountains, with occasional intervals of cultivated plains, are too well known to make many words about them here excusable; and we must now go along even more rapidly than heretofore, simply indicating the continuity of our six weeks' route. The residence on the Isola Bella, the whole a glorious feature seen from a distance, and indeed offering much for near examination that is very curious and interesting, is occupied by the present Count Borromeo; the rooms, lined with pictures of not very high character, being well kept. Some mosaic beds, by the way, such as have been imitated in the new gardens of the Royal Horticultural Society at home, will be noticed in the grounds, with many things that are more pleasing. At one time Isola Bella was deemed an enchanted island, a paradise on earth. Then "taste" changed, and nothing good could be said of it. Both opinions must now be thought wrong. Few will visit, with moderate expectations, this remarkable example of what energy and money can accomplish with only a barren crag to work on, without full satisfaction and great pleasure. Lovers of nature will find even more to delight them on Isola Madre, close by, where the vegetation is of the richest character. The prickly pear, of an immense size, with leaves 18 and 20 inches long, enormous aloes, some in bloom, growing out of the rocky sides of the island; oranges, citrons, the bamboo, with its lovely light green spiky leaves, and a poplar "*Carolina*," with leaves of startling size at the top, are some of the features that first attract attention and excite wonder: while the more minute inquirer in such paths will perhaps note down the *Oleacles Dichimales*, with oleander-like leaves and scarlet bloom; the *Datura Umilis*, for its pleasant scent; the *Plombago Zelenica*, with a small blue flower and honeysuckle leaves; or the *Arbutus Integrifolia*, looking, poor thing, as if flayed alive. The view of the lake from the summit-terrace of this remarkable place, thus rock mantled with gold, where many bits of the gardens are quite as startling as any of Beverley's fairy retreats in paint, is truly suberb; beautiful to sublimity.

The Lago d'Orta is about seven miles to the west of the Lago Maggiore, into which, indeed, it discharges its surplus waters, and is the object of a pleasant drive from Arona. It is small, about eight miles long, but very picturesque, and presents two or three points of great interest; as, for example, the pleasant villa and gardens of Count Natta, admirably laid out in winding paths, shaded by trees and fringed with ferns; the Sacro Monte, at the back of the town, with its remarkable groups of terra cotta figures; and the ancient church on the Isola san Giulio, in the lake. Taking the last first, a date as early as the fourth century is claimed for part of the church, and, without combating or inquiring into this, we are quite ready to consider the capitals of some of the attached and detached cylindrical columns in the nave aisles as belonging to a period anterior to the tenth century. These capitals are square blocks, the lower part sloped away on all sides to accord with the size of the column, and ornamented on the faces with incised lines, in the shape chiefly of simple volutes, and, on most of them, a star-form, not unlike the common star-fish. The pulpit, according to a remarkably intelligent and genial priest who accompanied us over the building, was set up in the year 900, under known direction. The sculptured ornaments of it include early leafage and a Sagittarius. Scattered about, the piers and walls display frescoes, some of them excellent, but all much decayed and destroyed. In the sacristy are a few paintings, some of them under good names. The island, as a whole, has evidently seen better days.

The groups on the Sacro Monte, the toilsome ascent to which is shortened and made agreeable by a road through the gardens of the villa we have named, are contained in some twenty buildings which we may call Stations, and represent events in the life of St. Francis of Assisi, to whom the church crowning the whole is dedicated. One of the groups represents St. Francis in Palestine freeing Christians; another a carnival at Assisi. The figures are life-size, brightly coloured after nature, energetic and expressive. Carlo Beretta, Bussola, and others, were the artists. The walls of the various buildings are decorated with paintings to correspond.* The whole is a strange puppet-show that fatigues before half is seen. As a relief, we ascend the unfinished Belvidere, and enjoy the splendid panorama there presented. The lake is divided into two; the mountains,—one at the end of the lake bears an old castle,—are sprinkled with villages, villas, and churches. The water is blue as a sapphire; the sky a paler tint without a speck; the near hills are covered with verdure: observe that one delicious bit where its bright green cuts against the intense blue of the lake. It is impossible to talk: it is as much as one can do to enjoy!

And now back to Arona: to-morrow we must re-cross the Alps, and say Farewell to Italy,—for a time.

ON GREEK ARCHITECTURE.†

FORTY years ago a lecture on Greek Architecture must have had a different scope from that which it has at present. For the cycle of architecture which the civilized nations have been running over during the last three hundred years has been this, that instead of developing from previous types as the Greeks did, and our European ancestors in the twelfth and thirteenth centuries, who attained a place in art more meritorious certainly than the Romans, whose architecture is little more than an echo of the Greek—fainter and more confused than the original,—we have been content to imitate old forms of art. This system of imitation, which now seems inveterate, was then running strongly in the Greek channel, and a lecturer must have had the knowledge that his hearers (could such a circle have then been gathered before him) were actually engaged in putting Greek dresses on their designs, no matter whether they would fit them or not, if only they would pass muster as Greek. It is now extremely improbable that any of us should be called upon to design anything in Greek; and we can afford to smile at the follies which have passed away from us. But are we not subject to a tyranny quite as illogical, tied and bound by similar bonds, but of another colour? We have changed our fashion, but not our way of life.

We are cured of the Greek mania, which almost exclusively occupied our architecture from 1770 to 1830, and with perhaps only one remarkable exception, are ashamed of its results. But are we to regret our admiration for the Periclean arts? Assuredly not. We shall sooner or later be disenchanted of our present thraldom, and be ashamed of most of the works of the present day. But should we do well, then, to regret our admiration of such buildings as Lincoln, Salisbury, and Westminster, Chartres, or Bourges? As little the one as the other. It is the habit of retrospection that is our bane, and we shall regret the use of forms and details which we choose, not because they are in themselves well adapted for our modern wants, but because they have been successful under other conditions. It is, perhaps, a necessary state of things, that as a reaction and co-existing with this servility to precedent, there is an extreme hankering after novelty, and it takes the form of rendering us sticklers for details, but careless of principles: could we reverse this order, we should, I believe, find what we desire.

It may be asked what use can we make of the older and recognized styles, if we are not called upon to reproduce their forms. Much every way. The spirit and principle cannot be too deeply studied. The Greek and Early Gothic are the two most remarkable of the bygone styles, and both were arrived at by a similar process. We have not so many links of the chain extant in the case of Greek architecture; but, as I shall hope to show, enough to satisfy us of the truth of the assertion, that the Greeks arrived at their architecture by adopting germs which they found among the older races from which they sprang. They did not transplant, but raised a new tree from seed, and went on adapting and refining for a long period. Our Mediæval ancestors did the same, and if I deprecate our now imitating their architecture, it is not from want of the most profound love and veneration for the works of the great period from 1100 to 1250. The practice of copying Greek architecture is passed away, and it is well. That of copying the Gothic will not be enduring, and the sooner it is passed away the better for true architecture. But there are deep principles involved in both styles which are essential to art in general, and it is for the evolution of these principles that Greek architecture claims so high a place in our regard.

The origin of Greek architecture is involved in mystery. I recommend to those who wish to pursue the subject further than is possible in a lecture, the careful study in Mr. Fergusson's "Principles of Beauty in Art," of the whole of the 110 pages which treat on the architecture and arts of Greece; but for the illustration of what I have claimed of the free spirit in which the Greeks derived their architecture from germs of pre-existing work, and so altered and naturalized it that they made it absolutely their own,—a few observations are necessary.

It is clear that Greece was peopled by two distinct races, at least as distinct as Celtic and Saxon among ourselves: namely, one race the semi-Asiatic Pelasgi, akin to the Ionians and Etruscans; and the other race, the Dorians. Of these two, the Pelasgi are first known to us as the dominant race; and to them belong the rude remains at Mycenæ, and similar works of fortification, and of an engineering character of a date probably not less than 1200 B.C. About the year 1100 B.C., the Dorians, who had repeatedly struggled with the Pelasgi, obtained the ascendant. This event is a turning point in Greek history, and is called the return of the Heracleidæ. The Pelasgi who remained in Greece became subject to them, as our Saxon did to our Norman forefathers. The head-quarters of the Pelasgic race was then found in Asia Minor, from which the race had originally come; and from thence their arts reacted upon Greece. The Doric architecture, however, although perhaps not older than some Asiatic Ionic, claims the earliest examples in Greece proper. The Dorians, if not akin to some of the Egyptian races, at least had inhabited Crete, and their traditions assigned to their Jupiter a Cretan origin. The intercourse between Crete and Egypt must have been considerable; and we have a remarkable connecting link between an Egyptian monument and the Greek Doric. The rock-cut tomb at Beni Hassan, in middle Egypt, doubtless is an excavated representation of some structural type, and points out that the Dorians derived the form of their column from the banks of the Nile; but derived the germ only, for where we meet with it first at Corinth, we find the dry shaft and the abacus turned by the magic of genius into a most noble form, the magnificent echinus giving it a meaning and a purpose which were merely latent in the Egyptian example. The framed timber construction of the primitive temples of Greece suggested the superstructure. But observe with what nobility and skill the type is translated into stone. The massive architrave intensely square giving value to the circular features of the columns. The frieze still square, but relieved by the upright lines of the triglyphs. The cornice, with its mighty shadow emphasized by the undercutting of the soffit, the mutules added to break up the cast shadow upon the frieze and architrave. It is unnecessary to consider at length whether the triglyphs and mutules are petrified beams and rafters. It seems likely that the wooden type suggested the idea, but in the

* At Varese, by the way, there is a similar Sacro Monte dedicated to the Virgin. The groups there illustrate the mysteries of the Rosary.

† By Mr. F. C. Penrose; read at the Architectural Association, as elsewhere mentioned.

stonework the artist has taken possession of them, and used them with creative intelligence for contrast of form, and light and shadow. Compare the poverty of the treatment of the carpentry type in the Lycian tombs, of which we have examples in the British Museum, where the details of the carpentry are shown with amusing reality, and without any feeling of repose or breadth.

The Ionic order appears to derive its origin from Persian and Assyrian prototypes; and there seems to have been considerable affinity between these races and the Ionians, whose abode also was in the western parts of Asia Minor and the adjacent islands. The exuberant growth of the Asiatic soil was refined by the free nature of the Ionians themselves, and finally perfected when grafted on to the Dorian stock, especially at Athens.

Athens, Tegea, and Bassæ contain all of which we have any record of Ionic architecture in Greece proper. The remains at Tegea have not yet been brought to light. Those at Athens and Bassæ are most important. But there are remains of great beauty in various parts of Asia Minor. The British Museum has lately been enriched with specimens from the Mausoleum of Halicarnassus of this order; and the Temple of Bacchus at Teos has lately been explored by the Society of Dilettanti and found to have been a temple of very great beauty. The prototype of the Ionic order seems to be found at Persepolis; and a bas-relief representing a fishing-lodge or pavilion has been claimed as exhibiting the germ from which the Erechtheum was developed.

If in the two cases cited, one of the Doric and the other of the Ionic prototype, it be contended that, granting these are both rightly so claimed, yet such rude elements could not have been adapted by the Dorians or Ionians without improving on them, and that improvement may be expected in proceeding from such simple and barbarous elements; but that we, who have originals both of classical and Mediæval architecture of high perfection as our prototypes, cannot proceed in the same manner, but must content ourselves with such variety as may spring from composition. It must be borne in mind that there were then existing both in Egypt and in Persia buildings of the very highest technic excellence; but the Greeks borrowed little from these, but saw what they wanted latent in these less important structures.

With the exception of propylæas, or ornamented gateways, which exist in several places most conspicuously at Athens, our knowledge of Greek architecture is chiefly confined to temples. Their private architecture was humble,—this is the secret of their great results in public works;—and the remains of their lesche and gymnasia, which served to them the purpose of clubhouses, are very slight indeed. Dicæarchus, speaking of Athens about the year A.D. 400, remarks that the streets were so narrow, and the houses so small and inconvenient, that a stranger suddenly placed in the town would doubt that he was in famous Athens, but would soon be convinced of it when he saw the Odeum, the handsomest in the world; the theatre—magnificent, great, and wonderful; the sumptuous, conspicuous, and admirable temple of Minerva, rising above the theatre, and filling the spectator with admiration.

A knowledge of the different classes of temples is necessary to our appreciation of the subject; and this cannot be better given than in the words of the late Mr. Woods, "Letters of an Architect:"—

"The cell of a Greek temple is an oblong building. In the earlier periods it was probably nearly destitute of ornament except the cornice. Afterwards, a porch was added, supported by columns, and the entablature began to receive some embellishment. Even this disposition, when the front came in view, was highly beautiful, and more so when an additional range of columns was added to the portico; after which, columns were added at the back also, by which means the variety and contrast produced by them would catch the attention from every point of view. The next step was to continue the columns all round, such as the arrangement of the Temple of Theseus.

The simple cell had, I believe, no peculiar appellation; and yet, from the great multitude of temples existing in ancient Greece, it is probable they were not uncommon. Temples of the second sort were said to be *in antis*, because in them the flank walls were prolonged beyond the front, so as to form the sides of the porch, and these prolongations were terminated in pilasters of three faces, which pilasters were called *antæ*. The third arrangement was called *prostyle*; the fourth, *amphiprostyle*; the fifth, *peripteral*. Besides these, there were also *dipteral* temples, having two rows of columns roundt he cell—such was the Temple of Jupiter Olympius at Athens; and *pseudo-dipteral*, which differed from the dipteral by the want of the inner row of columns, and from the peripteral by having a much larger space between the cell and the external colonnade. . . . .

The simple cell must always have been deficient in richness of detail; for though the walls and cornices might be richly ornamented, yet those details could not have produced sufficient effect on the whole composition. For that purpose it is necessary that the building should be divided into principal masses, whose position with respect to each other must produce some degree of variety and intricacy.

The temple *in antis* must also, in some degree, be deficient in richness; and I know of no temple of this sort which has been much admired. But the prostyle, and still more the amphiprostyle, if well proportioned, will always be admitted in the rank of beautiful buildings. From almost every point of view you see at least one column gracefully detaching itself from the mass of the building, and the nakedness of the side walls contrasts with the bright lights and shadows of the ends, and claims our admiration, even when compared with the higher finish of the peripteral temple. The eye, however, will not be satisfied with some intricacy in the disposition of the general masses. It will require a similar gratification when it comes to examine the details; and this we find accomplished by fluting the columns, moulding the capitals, dividing the frieze, at least, by triglyphs, and frequently placing sculpture at intervals between them, and adorning the pediments with sculpture, and placing antefixæ or ornamental convex tiles along the eaves."

Temples with four, six, eight, or ten columns in front were called respectively tetrastyle, hexastyle, octastyle, decastyle, &c. It is, however, impossible in a single lecture to proceed with any further analysis of the peculiarities of different temples. What concerns us most is to endeavour to catch the key-note, and see wherein the great strength of their system lies.

A state of political excitement and of considerable freedom was favourable to the perfection of the arts of Greece, and it cannot be denied that the "peculiar domestic institution," as well as the climate, which allowed the freemen ample time for moving in public and out of doors in the market-places and schools, led to keen discussions on matters of art and to the intimate knowledge of the subject which pervaded all ranks of the free population. This, however, would not have sufficed to secure the perfection in art of which we are so sensible, had not the Greeks had the good sense or instinct to confine themselves to a comparatively limited range of subject, such as working out, with moderate variations, only the classes of temples which have been enumerated; every succeeding work, up to a certain time, being an improvement on what had gone before. The oldest Doric temple which exists is the hexastyle temple at Corinth. The date is unknown, but it is impossible to assign it a date later than 600 B.C., or to suppose that the Doric order had not been developed for at least half a century previously (I wish in these dates to keep well within the mark). The most recent Doric temple in Greece proper, of any importance, is probably the hexastyle temple at Nemea, to which an approximate date of 400 B.C. may be ascribed. The temple called the Portico of Philip, in the isle of Delos, must have been built about 350 B.C.; the Parthenon was finished 438 B.C. We thus see the most versatile nation of antiquity engaged in the continuous pursuit of what seems at first sight a very simple problem during three hundred years at the least, and that two hundred years must have been occupied in working up from the example at Corinth to the higher perfections of the Parthenon, which was finished, as before mentioned, in 438 B.C., when Athens culminated under Pericles, just previous to her unfortunate collision with the military power of Sparta, when her light, although not quite extinguished, lost its lustre, and the arts of Greece followed her decline. What Greece might have produced but for the Peloponnesian war it is vain for us to conjecture: enough was achieved to make us thankful for what she did, and to invite us to imitate her principles of action.

The stages between the example at Corinth and the Parthenon (speaking of extant remains only), seem to be the Temple of Jupiter Panhellenius in Ægina, and the Theseum at Athens. The temple at Pæstum in Italy, and Selinus, Segeste, and Syracuse, in Sicily. The results of this elaboration and continuous effort in one direction were a thorough knowledge of the effect of position, harmony between the supports and voids, and exact contrasts between the round and the square, and the light and shade. They attained also a profound knowledge of the effect of perspective on the distribution of their columns. Observe the unbroken stylobate giving the temple a foot, as it were, to rest upon. The column gracefully diminishing—multiplied without being weakened by its shallow flutes tapering in such delicate curves of entasis, that in the Athenian examples, the existence of it was at first denied. The echinus—distinctly but delicately separated from the shaft by its annulets—itself a marvel of refinement. The hyperbolic curve receiving a cast shadow from the abacus of infinite gradation, and varying with every altitude and angle of the sun. The column, moreover, inclined inwards, at an angle imperceptible to the eye except by its indirect effects, viz., the feeling of perfect security, and a sense of more absolute perpendicularity imparted than if its axis had been true to the plumb line; for if columns are placed quite perpendicular, the effect is that of a slight divergence. Again, the horizontal lines are not straight and level, but are slightly curved, rising towards the centre. Otherwise the contrast of the sloping lines of the pediment with horizontal cornice was found to make them appear depressed in the middle.

Observe, too, the light and shadow caught on mouldings of exquisite form and finish, and of simple and refined proportion contrast everywhere perfectly understood, and the most dignified reserve exhibited both in the quantity and quality of the ornament; and above all, the whole temple made the framework to receive sculpture of such surpassing merit, that even those who would fain depreciate Greek architecture have not dared to cast a slur upon it, or challenge its accepted excellence.

Surely for such an achievement as this, it was worth while to go on for three hundred years without departing much from the track of those that had gone before; to give up the luxury of designing every new building as unlike as possible to what had preceded it. This morbid desire for novelty of composition, accompanied as it is by a demand for precedent in detail, is one of the great stumbling-blocks of modern architecture, and while too much obeyed ease and breadth are impossible.

All these reflections might have been arrived at from considering the development of the grand style of the later Romanesque and the earlier Gothic from the rude modifications of the Roman type, as adapted to the uses of the day by the builders of the tenth and eleventh centuries; but the aim being much simpler in Greek architecture, and the success more perfect, it appears to give the more valuable lessons.

The question we may frequently ask ourselves with advantage is, what these architects would have done under such and such circumstances. A Greek architect certainly would not have built the cell of a temple,—a form which was essentially a shrine,—to hold a congregation of 2,000 persons, as our St. Pancras, any more than an architect of the twelfth or thirteenth century if required to design a church where a great object was to place a large congregation near the pulpit, would have encumbered the most valuable part of the space with the supports of a central tower.

It may be asked, how can we oppose ourselves to the demand for a prevalent style, or influence the taste of the public? It cannot be done suddenly. If it could, it might not be desirable. No one can choose his own line without reference to other people; but consistency and the determination to give common sense the preference over fashion whenever circumstances will permit it, will do much. Some people have dreamed of an altogether new style of architecture. This I consider quite impracticable. They would break the magnetic circle of art, and leave us, so to speak, paralysed, or in a wild state, as it were, of mental aberration. As reasonable would it be in our old families to forswear their predecessors, and give up the *prestige* of noble birth; or, as a still better analogy, it would be as unreasonable in our philosophers were they suddenly to deter-

mine to divest themselves of all they have learnt in mathematics, in the hope that something might turn up different from the course of study which has been enriched by the labours of Newton and Laplace, and thousands of others of less individual distinction, but whose aggregate labours have contributed not less than those gigantic intellects. The wish so fondly expressed for a new style of architecture, however, has its foundation in a real want. If some phase were developed, founded although it might and must be, on something which has gone before, but by no means copied from it; which was sufficiently expansive for all modern wants,—which could accept the help offered by new materials, and digest and thrive upon them, although either classical shapes or, as it might be, Mediæval, still characterized its decorative features,—if it were something which all thinking men could conscientiously approve, we should then hear little more about the wish for a new style of architecture.

I cannot think that the present movement is unfavourable for such a development. We have almost ceased even in the Gothic revival to copy the masterpieces of the thirteenth century. I do not say to those who are enamoured of the Gothic that they should relinquish it, but I ask them to look forward a little and see what we seem to be coming to. Can anything be so incongruous as the new pseudo-Gothic buildings which are rising all around us? I do say to them,—If you consistently believe that Gothic architecture will lead to the best results; is most adaptible to the requirements of modern civilization: if it can accept the service of iron and the massive materials which ought to be used in this day, when, instead of having at our command, as the Egyptian kings, the brute labour of myriads of slaves, we have at our beck a power a thousandfold more mighty and far less expensive: choose, then, your elements out of the finest Mediæval architecture, and develope what is wanted out of them, and let all who sympathise work together continuously at the improvement of such development. I cannot but think, however, that some form or phase of the Classic architecture is more adapted for such development, especially the variety called the Cinque Cento; that is more plastic, more in unison with modern wants and feeling. To those, then, that can receive it, I would say,—Look at what was done in the North of Italy between 1450 and 1550, and to some extent also, in a similar style, in France; Germany and our own country having a few examples. It has several points of excellence in common with Greek architecture, especially the tenderness of its carved ornaments and the perfection of the sculpture with which it is generally enriched. Look, then, to the elements of this architecture, and see if something fit for our nineteenth century may not, by judicious treatment, be derived from it. The great secret, however, is, whichever way we pull, to pull altogether.

Reverse the advice which was given to young men some years ago, and perhaps is still, viz.: that we must avoid all similarity to the works of contemporary architects, for fear of being plagiarists, but may copy as closely as we please old examples. It would be far wiser, not, of course, to copy as too closely, but to steer in the same direction with such contemporary architects whose works well fulfil their purpose, and try to improve upon them. Let us remember that ease and breadth are far greater qualities than originality as now understood. Ease and breadth patiently sought for really lead to far deeper properties of originality than result from trying to design in a manner unlike our contemporaries. Natural preference and honest obedience to common sense in following the conditions of our work cannot fail to keep us from being plagiarists without taking any violent steps to avoid it: but union is strength, and pulling together in the same direction can alone overcome the inertia of the present dead-lock.

In recommending the development of the Cinque-cento, I consider that the current is now perhaps setting too strongly against Greek architecture to allow of any *point de depart* which is strongly imbued with Greek feeling; but there was one lately amongst us who more fully and intimately understood this architecture than any of the moderns—who entered into its spirit—whose mind found there something to reflect its own purity and refined elegance—whose works not in one instance show the timid hand of the copyist, but the genius of one capable of developing a new current of architecture out of the Greek type—one who rarely, if ever, allowed blind admiration for past beauties to interfere with modern requirements.

Very lately in these rooms were exhibited the sketches by that master-hand and the compositions of that discriminating and inventive intellect. His name is already in your minds, and, I may add, in the hearts of all of us who had any intercourse with him. I say distinctly, that if his works were to be chosen as a *point de depart* in all designs of a classical character that are demanded, and if our efforts were continuously exerted to improve upon them, and to reduce the style which he has mapped out more uniformly and universally into harmony with modern requirements, launching out boldly into the deep, and not refusing, if called upon, to sail where no landmarks of classical times are in sight, we should, in a very few years, have an architecture of our own equal to all our aspirations. When, in the beginning of this lecture, I spoke of our being on the whole ashamed of the results of the Greek revival, I stated that there was one remarkable exception. You will now readily understand what I was thinking of. We are *not* ashamed of Professor Cockerell's works.

VANDYCK IN ENGLAND.*

"And often took leave, but seem'd loathe to depart."
Prior, circ. 1699.

RECROSSING the English Channel, Vandyck visited Italy by way of Antwerp and Brussels. With Rubens he would appear to have parted on the most friendly terms, leaving behind him for his illustrious master's acceptance a portrait of his wife (a capital performance), an "Ecce Homo," and a night scene of the "Seizure of our Saviour on the Mount of Olives." Rubens, in return, acknowledged his pupil's compliment by the gift of one of the finest horses from his stables. Noble impulses of this nature are not common among artists. When Reynolds spoke of his rival Romney, he spoke of him as "the man in Cavendish-square." When Romney spoke of his rival Reynolds, he spoke of him as "the man in Leicester-fields."

Venice, Genoa, and Rome, first attracted and retained Vandyck's attention. At Venice he drank deeply of Titian, Tintoretto, and Paul Veronese. At Genoa he painted several portraits in what is called by some his earliest and best manner. Two were procured at Genoa by Sir David Wilkie, for Sir Robert Peel, and are still at Drayton Manor. They are companion pictures, full-lengths, seated, and represent a Genoese senator and his wife. These two portraits are valuable specimens of the master, full of truth and character, particularly the head of the old senator. In both, the hands are painted as only Vandyck could paint them. Several still remain. In the Durazzo Palace are "Two Boys and a Girl," in his finest manner, richer in colour and with more rotundity than Wilkie had before remarked in the same master.†

From Genoa he went to Rome, where he avoided the low conversation of his countrymen, and was commonly called "Pittore Cavalieresco." Here he drew his famous portrait of Cardinal Bentivoglio, one of the glories of the Pitti Palace, and the picture of Vandyck's Italian period which artists and connoisseurs alike esteem as the masterpiece of the master.

Quitting Rome he removed to Palermo, from whence he was soon driven by the plague, but not before he had extended his reputation by a portrait of Prince Philibert, of Savoy.

From Palermo he retraced his steps to Genoa, where he resided until his return (1626) to his native Antwerp. He was then twenty-six. His journey enabled him to add some of the noble qualities of the Italian school to the glowing characteristics of his Flemish style.

Memorials of what he wrought in Italy are still to be seen in Italy. I have already mentioned what remains at Genoa. In the Pontifical Palace on Monte Cavallo are two historical pictures of great value, "The Ascension" and "The Adoration of the Magi;" others are to be found in the Braschi, Colonna, and Corsini palaces,—for his was always a ready and industrious pencil.

The next six years of his life (1626—1632) were spent at Antwerp and the Hague. He was not idle. He painted three Crucifixions for three different churches; one for Antwerp, a second for Mechlin, and a third for Ghent. Sir Joshua Reynolds describes them with great minuteness in his "Notes of a Tour in Flanders and Holland;" and few who travel (*Murray-handed*) omit to read and apply the judicious observations which Reynolds was so well qualified to make. The picture at Ghent, one of his most capital works—since all but ruined by over-cleaning—is now best known by the fine engraving from it by Bolswert.

To this period of his career belong a "Marriage of St. Catherine," in her Majesty's collection; a "Virgin and Child," in the Bridgwater Gallery (the original of the fine duplicate at Dulwich); a "Virgin and Child," in the Grosvenor Gallery; an "Assumption of the Virgin," in the gallery of Mr. Hope; and the "St. Ambrosius refusing to admit the Emperor Theodosius into the church at Milan," an Angerstein picture, and now in the National Gallery in London. Other works assigned to his middle period are at Berlin, Munich, and Vienna.

Portraits, too, of this period of his pencil are numerous and fine,—none, perhaps, finer than the companion whole-lengths of Philip le Roy and his wife, bought (1850) by the Marquis of Hertford, at the King of Holland's sale, for the sum (nor was the price thought large) of two thousand five hundred guineas.

At Castle Howard is the far-famed to-the-knee portrait of Snyders, the painter, one of the treasures of the Orleans collection; and at Warwick Castle, the companion picture of Snyders's wife, from the same gallery. They have been seen together on the walls of the British Institution, and were much and deservedly admired;—Lord Carlisle envying Lord Warwick, and Lord Warwick envying Lord Carlisle. At Holkham (Lord Leicester's), is Duke Aremberg on horseback, one of the most spirited of his equestrian portraits; at Panshanger (Lord Cowper's), his Nassau family; at London, in our National Gallery, that marvel of art, the so-called "Gevartius;" and at Montagu House, Whitehall (the Duke of Buccleuch's), thirty-five sketches (*en grisaille*) for the celebrated series of portraits etched in part by himself, and published by Martin Vanden Enden.

A very celebrated picture, painted at this time, is "The Holy Family," 7 feet 0½ inch high by 9 feet 1½ inch wide. It belonged to King Charles I.; was twice sold for 1,400*l.*, and from the house of Orange was bought by Sir Robert Walpole. It hung in the large saloon at Houghton, has been well engraved, and is now at St. Petersburg. "The chief part of it," writes Horace Walpole, "is a dance of boy-angels, which are painted in the highest manner. The Virgin seems to have been a portrait, and is not handsome; and the piece is too much crowded with fruits and flowers, and birds. In the air are two partridges finely painted." In the Houghton valuation the sum placed against this picture was 1,600*l.*

In the Pell Records of the year 1629, is the following entry:—

"By order, dated the 23rd of March, 1629.—To Endymion Porter, by one of the Grooms of His Majesty's Bedchamber, the sum of 78*l.* for one picture of the story of Rinaldo and Armida, bought by him of Monsieur Vandyck, of Antwerp, and delivered to His Majesty without account, &c."

This picture, King Charles's *first* acquisition of a Vandyck, is now at Clunber, in Notts, the seat of the Duke of Newcastle, and formed No. 653 of the Manchester Art Treasures Exhibition of Ancient Masters.* It is a large picture, and is described by Dr. Waagen in a note made by him on the spot, as "fine in keeping and carefully finished;" but what the learned doctor fully means, or meant, I will not pretend to explain.†

In the appraised catalogue (among the Harleian MSS.) of King Charles's Collection, may be seen this entry:—

"Fol. 150. A piece of Nicholas Laniere to the knee. 10*l.* Sold Nicholas Laniere, 2nd November, 1649, for 10*l.*"

It was on seeing this half-length portrait of his servant Laniere that King Charles I. was induced to invite Vandyck into England. The story, as told by Sir Peter Lely (and preserved by Mr. Beale, the husband of Mary Beale, who painted portraits in the reign of Charles II.), is as follows:—

"Mr. Lely told me at the same time as he was most studiously looking at my bishop's picture

* See p. 40, *ante*.
† See Wilkie's Journals in his Life by Allan Cunningham, 3 vols. 8vo.

* I may mention in a note that the information in the text was unknown to Mr. Scharf, the compiler of the catalogue of "Paintings by Ancient Masters."
† Sir Robert Peel had a sketch in sepia of the same subject (Waagen, Art Treasures, i. 415).

of Vandyck's, and I chanced to ask him how Sir Anthony could possibly devise to finish in one day a face that was so exceedingly full of work and brought up to so extraordinary a perfection. 'I believe,' said he, 'he painted it over fourteen times;' and on that he took occasion to speak of Mr. Nicholas Laniere's picture of Sir Anthony Vandyck's doing, 'which,' said he, 'Mr. Laniere himself told me, he sat seven entire days for it to Sir Anthony, and that he painted upon it of all those seven days, both morning and afternoon, and only intermitted the time they were at dinner.' And he said, likewise, that though Mr. Laniere sat so often and so long for his picture, that he was not permitted so much as once to see it till he had perfectly finished the face to his own satisfaction. This was the picture which being shew'd to King Charles I. caused him to give order that Vandyck should be sent for over into England."

This fine picture, long in the collection of Lord Chancellor Henley at the Grange, in Hampshire, is now (1864) the property of the Marquis of Westminster.

Of Nicholas Laniere, made immortal on canvas by Vandyck, so little is known that I may be excused a short digression concerning him.

There were two Lanieres of the same Christian name in England between the years 1560 and 1646, well-known men at court in the reign of Queen Elizabeth, King James I., and King Charles I.

In the M.S. accounts of the Treasurer of the Chamber to Queen Elizabeth, the following entries (now first published) are to be found:—

"Payd to Nicholas Lanuyer flute in the rome of Gillm Trochea deceassed upon the Q. Ma^s warrant donn during lief dated at St James' the xxv^th of October A°. iij^e [1560] for his wages of xx^d ꝑ diem—vij^li xj. vij^d yerely for his boarde wages and xiij^li. vj^s. viij^d. yerely for his lynery all to hee payde quarterly dew unto him for one hole yere ending at Mich^as A°. iiij^o. lij^li. vj. viij^d. and also in wave of her Ma^s rewarde for that tyme onely xvj^li. vj^s viij^l In all lxiij^li viij^s iij^d."

"Payde to Nicholas Lanyer musicon for the flutes upon the counsell's warrant dated at Westm^r. the last daye of March 1561 [4th of Eliz.] being sent wth. Letters into Fraunce to S^r. Nicholas Throgmton x^li."

These entries relate to the father; the following relates to his accomplished son—Vandyck's sitter:—

"The accomptaunte is allowed for money paid to Nich^as Lanyer his Ma^s servaunte for provicon of pictures in the partes beyond the seas for his Ma^s service by Privy Seal and acquittaunce xvij^m. vij^ch viij"

That is 18,700*l.* 7*s.* of the reign of Charles I. money, or some 57,000*l.* of the money of Queen Victoria; in other words, as much as England gave in the reign of George IV. for the Angerstein collection.

I will now return to Vandyck.

There was a man much employed at this time by the king and the Duke of Buckingham, and Lord Treasurer Weston,—conceited and crazy,—in short, a second Sir Toby Matthew. This was Sir Balthazar Gerbier, to whom I have had occasion already to refer: a kind of Dominus Do-all, painter, architect, negotiator and gossipping correspondent of great men: what he himself was like and what his family were like many will call to mind who remember the large family Gerbier group in the Rubens Rooms at Windsor. It was this Gerbier who bought abroad Vandyck's "Virgin and St. Catherine" for Lord Treasurer Weston; it was with this Gerbier, in his house in the Strand, that Rubens was lodged (as I have already had occasion to relate) during his visit to England, the king paying the charges of Sir Peter's entertainment; it is the same Gerbier who gives us the next earliest notice of Vandyck. Writing from Brussels on the 13th day of March, 1632, he informs King Charles I. that Vandyck was at Brussels and resolved to go over into England,—"*Et fait dire qu'il est resolu d'aller en Angleterre.*"

That he was expected in England there cannot be a doubt, for among Secretary Windebank's memoranda of "things to be done," still preserved in the State Paper Office, Mr. Carpenter discovered the following interesting entry:—"To speak with Inigo Jones concerning a house for Vandyck." He would appear to have arrived among us before any arrangement could be completed, and to have taken up his residence in the Blackfriars with Edward Norgate, a herald and illuminator, Keeper of his Majesty's Organs, and ultimately Clerk of the Signet to King Charles. On the 10th of May, 1632, a warrant was issued by the king for an allowance to Norgate of 15*s.* a day "for the diet and lodging of Signor Antonio Vandyck and his servants, to begin from the first day of April last past, and to continue during the said Vandyck's residence there."* This fixes the date of Vandyck's arrival in England: he came to reside and die among us on the 1st of April, 1632.

No one has told us why Vandyck went to live in the Blackfriars; but his reason for going there is at once characteristic and delicate. Mr. Carpenter supposes that "the Crown must have held property at this time in the Blackfriars, for the Count de Tillier, ambassador from France, in the latter end of the reign of James I. was lodged there; and Walpole states that Cornelius Jansen dwelt in the Blackfriars." There is no authority, however, for supposing that the Crown at this time held property in the Blackfriars, nor is there any necessity that such should have been the case to account for Vandyck's residence there. The painters of the reigns of James I. and Charles I. who settled in London, or visited London, lived without the City liberties; and they had two favourite places—the Blackfriars, then a privileged precinct for Puritan feather-makers, players, and painters; and the Strand and St. Martin's-lane, then, as long after, a fashionable quarter of the town, and near the Court. Mr. Carpenter, in mentioning Cornelius Jansen's residence in the Blackfriars, has omitted to refer to the more interesting circumstance, that Isaac Oliver and his son, Peter Oliver, great masters in the art of limning, lived there before him. Lady Ayres, wishing to have a copy of Lord Herbert of Cherbury's portrait, to wear in her bosom, went "to Mr. Isaac, the painter, in Blackfriars, and desired him to draw it in little after his manner."† The Painter Stainers' Company was at this time an active and acting company; and the rules they issued and the fines they levied on painters (foreigners especially) pursuing their callings *within* the limits of the City were extremely stringent and heavy. By living *within* the Blackfriars, the picture-drawers, as they were then called, were *without* the jurisdiction of the Painter Stainers; and this is amply sufficient to account for the selection of a locality of this kind. At the bottom of St. Martin's-lane, when Vandyck was before in England, lived Vansomer; and at the period of his present visit Mytens was living in St. Martin's-lane, about half-way up on the west side, two doors from Sir John Finett, Master of the Ceremonies to the King, and three from Sir Theodore Mayerne, physician to the King. Of the two localities which custom prescribed for painters at this time, Vandyck would appear to have selected the Blackfriars, though farther from the Court, because Mytens was already established in St. Martin's-lane, and his taking up his residence there would have looked like indecent opposition; while the Blackfriars, by the removal of Cornelius Jansen to Bridge, near Barhamdown, in Kent, was without a painter of either reputation or promise.

A painter of great promise—of promises amply fulfilled—set up his easel in the Blackfriars of London in the year 1632. What wonders he wrought, what thoughtful faces and lovely eyes, what manly forms and graceful figures he was to perpetuate, with a skill as yet unsurpassed, perhaps unequalled, will form the subject of my next communications. PETER CUNNINGHAM.

* Lord Chamberlain's Warrant Book MS. in the Lord Chamberlain's office.

BETHNAL GREEN.

OUR of evil good sometimes comes; and we are not without hope that the neglect, mismanagement, and want of proper feeling shown by the board of guardians of this large district, will be the means of causing the laws which are at the present time in force to be stringently applied, and will, if necessary, lead to fresh enactments, which would be the means of protecting the lives of the poor and distressed. It is difficult to understand the principles upon which the Bethnal-green guardians act: their operations are as contrary to all the rules of common sense as of justice and humanity. They have so far set at defiance public opinion, and seem to pride themselves on the "bars" which prevent the poor from obtaining proper relief.

It is impossible to convey any notion of the deep distress which rages here,—no pen could describe it,—no pencil could give a clear picture. Yet read the following note from the *Daily Telegraph*:—"Mr. Collins (the chairman) congratulated the board that, while there were eighty-eight applications this time last year, there were none at present. Amongst the applicants who had declined the test, was a widow, with four children. Mr. Collins thought that an exception might be made in favour of such parties." There was positively considerable discussion before this boon was granted.

So great is the misery here, that it is difficult to know where to begin, to convey some idea of the condition of a large part of the district. The more we investigate the more terrible appears the state of peril in which a great multitude are placed. Fortunately, the severe weather has ceased.

As we pass along, calling at house after house, we find in room after room the same deplorable depth of poverty. In some, women and children are without coal, and are sheltering for warmth in their miserable beds. It is not, upon the average, in one room in six that there is any bedstead,—only a bundle of black-looking rags in a corner. In one apartment a woman and her daughter were busy making lucifer-match boxes. The floor was covered with some hundreds of them, and, work as hard as the two could, they were not able to earn more than 5*s.* a week. The rent is 1*s.* 6*d.* a week, leaving 3*s.* 6*d.* for food. The girl, about sixteen years of age, looked modest and well-mannered, and might be useful as a domestic servant, but her clothes were in such a bad state that she could not seek for any employment in that way. In this instance, and in many others, at a very small cost, young girls might be rescued from extreme poverty and temptation, and put in the way of earning a respectable living. In one room, in No. 2, Shepherd's-court, we found the family of a house-painter who had been some time out of work. Notwithstanding the broken ceiling, everything in the place was perfectly clean. One child was sick without any hope of recovery. It had been attacked by scarlet fever, which had been followed by dropsy. Here were complaints of the neglect of the parish medical officer, but into these it would scarcely become us to enter. In this place and in others the eyes of the sick children have an anxious gaze, which haunts us long afterwards. In bustling thoroughfares, in the midst of crowded rooms, and in the still hours of the night, those imploring eyes seem to urge the continuance of a painful duty, in the hope that even the Bethnal-green Board of Guardians may be induced to do something for suffering humanity. This man and his wife has usually lived in houses of the same description as this, and of thirteen children only five are now alive. Before long the number will be four.

The ingenuity which is shown by the managers of ill-drained and ill-conditioned property—when reports are made to the magistrates, and orders for necessary changes given, to evade what is required to be done, is remarkable. On the pretence of doing what is needful, persons are set to work, who make some show at the entrance of courts and elsewhere, leaving the more important parts untouched. During this last inquiry, the opinions before expressed are more strongly confirmed, that in such a neighbourhood as this, the health of the poor should not be trusted to the Vestry Board. Some of the worst property—the most neglected—belongs, we are told, to a clergyman, who is also a *member of the Board of Guardians of this parish.*

The sanitary staff of the police, without any parade, but with great firmness, continue to perform their difficult duty; and the comparison between their work and that of the parish inspector of nuisances, is remarkable. Mr. Price, the police inspector, is not satisfied with one visit to an unwholesome place, but sees that what is ordered to be done is thoroughly carried out. The progress of improvement in this way is slow; but so far as the means afford, it is sure, and will, we trust, be carried forward to a much greater extent. The back-slums must be looked to, even when the outward appearance of a place would deceive many who have had experience; for instance, we will just glance at one spot, in Church-street, Bethnal-green. We see a barber's shop, gaily decorated: at each side of the door is the representation of a bear, with the announcement that the genuine article, bear's-grease, is to be had there: inside the place is smartly fitted up, and there are indications of prosperous circumstances,—notwithstanding, there have been nine cases of typhus-fever in the house and one death. The proprietor of the shop, at the time of our visit, was himself dangerously ill of this preventible complaint. Although at first there might seem to be no

proximate cause for this disease, when the premises are looked at the reason is evident. Except in those parts of the premises which the hair-dresser has put in order at his own expense, the place is miserably dilapidated; but bad as this is, the state of the drainage is far worse: from the untrapped closet passes an imperfect brick drain, which allows the poisonous gases to be distributed throughout the house.

ECONOMY OF FUEL IN STEAM ENGINES.

WE very much doubt whether the warning of Sir William Armstrong will have much indirect effect on the consumption of coal,—time alone will show. We hope, indeed, that the time is far distant when coals will be taken to Newcastle; but there can be little doubt that a good many of the coals yet at Newcastle might be saved. Prodigious quantities of what is in truth the heat, the light, the power of England, are being hourly converted into a gaseous form, and launched unconsumed into the vast airy ocean. Ceaselessly are heaps of fuel poured down the greedy throats of blast and other furnaces, boiler fires, and, not least, innumerable kitchen grates. There are, however, certain situations of, and uses for, the steam-engine, in which economy in the use of fuel is absolutely needed. A pretty large factory owner, for instance, with (say) 200-horse power on his premises, finds that economy of fuel, even where coal is cheap, means a large annual income. He knows that he cannot get an economical engine without some additional complication of its parts, but he also finds that the slight additional cost of repairs is more than counterbalanced by the coal bills. Not that factory owners, as a rule, are very economical in fuel. A tabulated statement now before us,—by the excellent Manchester Association for the Prevention of Boiler Explosions,—shows that the average consumption of fuel during the year 1860, in and about Manchester, was not much less than 7 lb. or 8 lb. per horse-power per hour. It appears to us that we may expect further improvements in the economical use of steam in those forms of the steam-engine in which it is either self-propelling or has to be carried about. Economy of fuel means economy of water; economy of fuel and water means a saving in steam and water space, and thus, as a further result, a saving in boiler-power, weight, and space. In no form of the self-propelling engine besides that of the marine engine is condensation admissible, from the great quantity of water required for the operation. We are thus mainly thrown on the resources to be found in the use of high-pressures of steam, and of expanding these high-pressures down to the atmospheric limit. Of course there are other means of saving fuel,—such as a very careful combustion of the coal, heating the feed-water, super-heating the steam, and other plans. A thorough and careful expansion of the steam appears to us the most legitimate way of saving fuel. An only very partial expansion of the steam is carried out in the railway locomotive by means of the cap of the slide valve, and the expansion slide link;—it remains to be seen whether the conservative tendencies of locomotive engineering enforced by the great need for simplicity on railways—will be overcome by some good mechanical arrangement. There is undoubtedly at present a great demand for economy of fuel in the portable and traction engines now used by building contractors, and by farmers for ploughing and thrashing. Here, again, comes into play what we may term the locomotive tendency towards economy of fuel. The cost of coal in ploughing is something like one-third of the expenses, and water and coal carrying make additional holes in the farmer's pocket. A great impediment to the general introduction of the traction engine lies in the absence of stations on common roads where it may take in its provisions of coal and fuel. A camel in the desert of Sahara, after having drunk up the water in what engineers would call its stomach tank, is not as helpless as our great monsters of traction engines far away, on a country road, from any supply of water or fuel. The economy of fuel in steam-engines is a vast subject, involving very many interesting problems in thermo-dynamics, requiring for their practical solution often very ingenious arrangements. For it may be laid down as an axiom that no economy of fuel can be got without some additions to the condensing steam-engine, some additional complication, if you like, and if the ordinary cylinder and piston, fed by a common slide valve, be accepted as the *beau idéal*, the *summum bonum*, the *ultima ratio* of engineers.

We have just examined what would appear to us a very efficient way of using steam.

At the New Foreign Office, now being erected by Messrs. Smith & Taylor, a portable engine is employed in working a set of stone-sawing frames. The engine appears at first sight like the ordinary 8-horse engine of the makers—Messrs. Hornsby & Sons, of Grantham. It will, however, be noticed that the cylinder is a little larger than twice the throw of the crank. It will be seen that the inventor aims at getting the advantages of a double-cylinder compound engine by means of one cylinder alone. This is, indeed, the leading idea of the construction of the engine, which is denominated "*a double-expansive single-cylinder steam engine*" by its inventor, Mr. E. E. Allen. A section of the cylinder shows that this long cylinder is divided in the centre, and on this division works a trunk, at either end of which is a light piston, held together by the piston rod,—in this case, a pistons' rod. Each of the two pistons works between the cylinder cover at the end and the division in the middle. There is thus a necessity for a separate slide-valve, and separate inlet and exhaust ports to each piston. On starting the engine, steam at the boiler pressure enters first the annular space through the steam port, and it may be cut off at 5-8ths of the stroke by means of the cap on the valve. The exhaust steam from the annular space having done its work therein, is led through the D-slide valve into the other end of the cylinder on the whole surface of the piston, and is at last exhausted from thence by the ordinary means. The return stroke is effected in the same way with the other half of the double cylinder. It will thus have been seen that the expansion is in the ratio of the area of the annular space to that of the whole piston—besides that afforded in the annular space by the cap of the valve. The valves are packed at the back in order to take off the steam pressure. The inventor purposes to adapt his cylinders to any engine where this may be feasible,—in fact, to accomplish with the horizontal engine what was attempted with the beam engine, by the so-called MacNaught system. We have seen some excellent indicator diagrams of these engines. It is a very great pity that this engine was not publicly tried on the friction brake, at the Worcester Show of the Royal Agricultural Society. It would then have been in strict competition with these complicated and unpractical *bêtes de luxe* racing engines. Mr. Allen will have to wait till 1866, we believe, for the next trials of this kind. The engine at the Foreign-office is stated to consume less than half the fuel used by engines of the same class. Of course, this is no accurate comparison. The peculiarity generally adopted by the Messrs. Hornsby, of putting their engines inside the fire-box, will be in this instance, where expansion is carried so far, highly beneficial—perhaps for the first time. We have every hope that this engine will stand the searching test of practice. Of course, cavils could be raised against it; but we know too well the usual difficulty of introducing an improvement, to increase the difficulty in this case by anything we might utter. Success, and success alone, makes engines, as well as statesmen,—shall we also say engineers?

THE DECAY OF BUILDING STONES.

IN the discussion which took place on the reading of Dr. Voelcker's paper on "The Effect of Smoke in producing Decay in Building Stones."

Mr. C. H. Smith said,—He had often been perfectly bewildered by the many scientific theories that had been propounded in reference to this subject. The paper had not alluded to the great variation in quality even in the same description of stone. As regarded Caen and Bath stones, they had been treated as being usually of one quality; whereas, it was well known that in every quarry of this stone there were four or five different varieties, as distinct from each other as possible; therefore it was not right to treat of it merely as Caen stone. The same might be said of Bath, Portland, and all the other colitic stones. If it were left to the builder or mason, he would soon find out the softest in the quarry, for it could be worked with half the labour that was required for the harder kinds, besides making the finest looking work when it was finished; and it was owing to this often occurring that an almost incredibly rapid decay of the material took place. In every district of the Caen stone there were eight or ten different quarries, and each of these had five or six different beds, so that there were at least fifty varieties of Caen stone, all varying in some respects from each other, and many of them of an inferior character. The decay of the stone in building was, therefore, in a great measure, owing to the bad selection of the material in the first instance. He had seen many instances of this, both in London and the country. He could mention many public and other buildings in London and elsewhere, in which the decay of the stone had been almost as striking as in the case of the specimens on the table. The Roman Catholic Church of St. George was almost as bad as it could be. The structure had been built within the memory of most present, and yet the stone was in a complete state of decay. The materials used were Caen and Bath stone, but not of good quality; and it was, therefore, in his opinion, more important to be able to select the best qualities of stone, than simply to ascertain their chemical constituents. Generally speaking the stonemason could tell, almost at a glance, the good and bad qualities of stone; but it was often not his interest to say anything about it. To give an instance of good and bad qualities of stone of the same kind, he would mention Portland stone, which had been used in London a great deal since the time of James I. The Chapel Royal, in Whitehall, was one of the first large buildings erected of that material, and Sir Christopher Wren used it for all his churches. The Monument on Fish-street-hill and Temple Bar were both constructed nominally of the same stone, and while the bas-relief representing the Great Fire of London was as perfect as possible, without a bad stone in it, it was well known in what a state of decay the west front of Temple Bar was, with exactly the same aspect. The different states of preservation of the two buildings were entirely owing to the different qualities of the same description of stone. At Somerset House, again, there was another remarkable instance of this. The river front was built by two different masons, under the same architect. One built the upper part and the other the lower. The part below the terrace was as black as could be, and was at the same time remarkably perfect: the upper portion was almost white, and there was scarcely a good stone in it; yet both portions of the building were of the same aspect, and the portion nearest the water was perfect, while that which was furthest from the water was very much decayed. It was after the bad stone had been used that chemists were set to work to try and find out something to stop the decay of our large public buildings, whereas the better plan would have been to have taken more care in the selection of the stone. He believed several thousand pounds had been expended upon the Houses of Parliament in trying processes to prevent decay, but up to this time he was not aware of any plan that was practically useful. A specimen was put into his hands some time ago to show how far the indurating material employed in one of these processes had penetrated into the stone, and he found that it had entered as far as three quarters of an inch; but that stone had been in the first instance put into a hot-air chamber to drive out all the moisture, and afterwards immersed in the boiling fluid, and by that means this result had been produced; but he need hardly say that it was not possible to put the Houses of Parliament or Somerset House either into a hot-air chamber or into a boiling fluid. Those appliances answered in the laboratory, but not in practice. His own opinion was that any of the substances at present known applied to the preservation of stone would not be neutral in their effects: they would either tend to preserve it or to hasten its decay. A great deal had been said in the paper as to the effect of water on stone: his own belief was, that if the stone was really good the water would have little or no effect upon it. By experiments he had made, he found that a cubic foot of Caen stone would absorb two gallons of water without showing more than a slight dampness on the surface. Hardly anything was more absorbent of water than a well-burnt grey stock brick; yet it was a very durable material. Mr. Smith referred to the church of St. Dunstan, in Fleet-street, as an example of exceedingly porous limestone exposed to the London atmosphere; and yet it had proved very durable. The decay of bad quality of stone was by no means restricted to London or other large cities, the

atmosphere of which was impregnated with the acids, &c., to the effects of which the destruction of stone was attributed by scientific men. The town of Oxford presented a remarkable instance of this. He knew of no town in so deplorable a state in this respect; and he attributed it entirely to the injudicious selection of the quality of stone. The effects of varieties of temperature upon stone had not been sufficiently taken into account. The extreme difference in the temperature of winter and summer in this country might be stated at 100 degrees. That, in his opinion, had more effect in producing the decay of stone than anything else. Take the case of a building exposed to two different aspects, such as the Horse Guards, which was built throughout as nearly as possible with the same stone. The north and east sides of that building were blackened and in a perfect state, while the decay was principally observable upon the sides facing the south and the west; owing, as he believed, to the greater variations of temperature to which they were exposed. Dr. Voelcker had implied that limestones were unfit for outdoor carvings, and if so, he should be glad to know what sort of stone was suitable, because they could only carve at great expense in sandstone; and, moreover, it was more or less laminated, and, in order to be durable, required to be put up in the position in which it was laid in the quarry, otherwise it became exfoliated.

Mr. G. F. Wilson, F.R.S., thought that Dr. Voelcker had treated this subject in a strictly practical manner. When a scientific chemist in the position of Dr. Voelcker explained what the particular form of decay in the stone was, showing that so large a proportion as fifty per cent. of sulphate of lime was present, it must direct the attention of practical men to the importance of using those particular kinds of stone which were not so liable to be acted upon by the sulphate of ammonia in the sooty atmosphere. The remarks of Mr. Smith, as to choosing the best portions of stone in a particular quarry, were very important. Dr. Voelcker attributed the decay of particular kinds of stone to the corroding effect of the black smoke of large towns forming an incrustation which reacted on the stone, somewhat in the same way as tartar acted upon the teeth, only with a different chemical reaction. That subject had been treated of several times in this room, and the different modes of getting rid of the smoke which occasioned the evil had been considered. A very simple method of preventing smoke in house fires was stated to be the having a grate with a false bottom and putting the coals in below, and removing them when in a glowing state from the bottom to the top of the grate.

Dr. Bachhoffner remarked that, judging from what had fallen from his friend Mr. Smith, every architect should be a Hugh Miller: but he thought very few architects could give that time to the study of geology which was requisite to bring them up to the practical standard suggested by Mr. Smith, as judges of the different qualities of stone. Hence the advantage of this Society and of the admirable paper brought before them this evening. He had not heard anything in the remarks of Dr. Voelcker as to discarding of limestones, and he apprehended that their disuse for ornamental purposes was not suggested; but the novel point with him, and one which was of considerable importance, was the action of the sulphate of ammonia in the soot producing double decomposition, and thus contributing to the decay. He knew no reason why every household should not be made to consume its own smoke. Mr. Wilson had alluded to a plan which he (Dr. Bachhoffner) patented some years ago, but no one would take the trouble to employ it. It had been shown by Dr. Arnott and many others that the proper way of lighting a fire was from the top. Lighting from the bottom was a wasteful plan, for the heat distilled the coals at the top, and their heat-producing qualities were thus to a great extent lost. A fire lighted in the way he had just recommended would remain alight for four or five hours, and require no stirring. He thought Dr. Voelcker was quite right in saying that smoke was the cause of the destruction of stone in buildings, and he supposed they must submit to this till the legislature made it imperative that every house should consume its own smoke. The table in the paper showed them that whilst the original composition of stone contained only one-tenth per cent. of sulphate of lime, in the decayed stone fifty-one parts out of 100 were converted into this salt.

Mr. F. A. Abel remarked, that there was no doubt the facts brought before them in this paper formed an important contribution to our knowledge as to the various causes which brought about the decay of stone. Mr. Smith had properly called attention to the importance of selecting proper descriptions of stone, of uniform quality, in future buildings; but it must be remembered that we had to deal with buildings already erected. With regard to the effects of moisture and of the different salts contained in soot, they were deserving of great consideration. Those who had given attention to the decay of stone would have noticed, that where the stones remained moist, as they would in some parts of a building, there the decay was greatest. This was not alone owing to the disintegrating action of the moisture, but was due, in a great measure, to the absorption of the saline materials which constituted so large a proportion of the composition of soot. On one point he differed from Dr. Voelcker—that was, as to the preservation of stone by artificial means. He had led them to believe that such a process as Mr. Ransome's would be successful. In that he (Mr. Abel) did not agree. In the composition used by that gentlemen there were different salts, which, by chemical reaction, were intended to deposit an insoluble substance upon the surface and within the pores of the stone. Doubtless this insoluble substance, silicate of lime, was produced; but there was also produced a soluble substance,—common salt,—which soon dissolved away, and left the pores of the stone open. The result was, the stone was not permanently protected; indeed, not more effectually than if some such substance as beeswax were applied, which for a time would fill up the pores of the stone, but would soon decay and require renewal. If they could discover a process (and he did not despair of this) by which they could get a preservative matter into the pores in a perfectly insoluble form, it would no doubt be valuable. To that end they were tending. He believed it was not impossible to deposit silica in a hard form in the pores of the stone without also depositing a soluble salt, and in this way they would effect what Dr. Voelcker had shown to be so desirable to prevent the decay of stone.

Mr. Bishop could state that what had been treated of as occurring to buildings in this country, took place to a considerable extent in other parts of the world, under totally different climatic influences. The English church at Alexandria, although erected only six or seven years ago, in sandstone, already exhibited signs of decay in some parts, particularly in the ornamental portions; whilst the mosques in Cairo, which had been built hundreds of years, also of sandstone, were in the most perfect preservation, and the richly-ornamented domes of those buildings, exceeding anything we have in this country, remained perfectly sound. Damp had been spoken of as having a great effect upon some description of stones. In Alexandria, however, there was no rain whatever for eight months in the year, but there was a palpable dampness in the atmosphere of an evening. He had no doubt the stones took up a great portion of that dampness. On visiting the obelisk at Heliopolis, on the sides on which the current of wind set, there was an incrustation nearly half an inch thick, with slight vegetation upon it. That appearance was presented on only two sides of the obelisk, and there must be some considerable degree of moisture to fix that earthy matter. A similar appearence was presented by the stones all over Egypt: there was something deposited on them which would produce vegetation if there were sufficient moisture for that purpose. With regard to the destructive influences of frost upon stone, they were, no doubt, considerable, though in many places in the East, where there was no frost, the stone was, nevertheless, much decayed. The Colosseum at Rome, though built of a very porous stone, was in excellent preservation. The Cathedral of St. Peter was built of the same kind of stone, as were most of the buildings in Italy which were not of marble. It was very porous, though also very durable. The Cathedral of Cologne appeared to have suffered from the decay of the stone more than any similar building in this part of Europe, and many portions had to be entirely rebuilt. With regard to Caen stone, as far as his own knowledge went, it appeared that those stones which contained the greatest portion of silica were the best resistants of the influences of the weather.

The Chairman (Mr. Hawes) proposed that the thanks of the meeting be given to Dr. Voelcker for his paper. This paper was of a highly practical character, containing, as it did, a collection of chemical results obtained by experiment upon decayed stones taken from various buildings. It was true that no remedy had been suggested in the paper, but perhaps that was not the object, but rather that of eliciting discussion and information. This was the kind of paper most likely to bring out that information, either as to what stone should be avoided, or how to make the material employed more durable. Mr. Smith had given them another set of facts, those of his experience as to the differences between one bed of stone and another. He had also shown how, in the same building, different degrees of disintegration in the same description of stone had taken place. Taking the instance of Somerset House, he had stated that the lower parts and those nearest to the water had suffered less than the higher portions of the building. Then, with respect to the Horse Guards, Mr. Smith had told them that the northern and eastern portions were less decayed than the southern and western, and this he attributed to the greater change of temperature to which the latter were exposed, but it must be remembered that these were also exposed to the winds most prevalent in this country; therefore, the condition of the stone being originally the same, we must infer that the sides of the building exposed to the winds and rains nine months out of the twelve would be mechanically acted upon to a greater extent than the other parts, and there would also be a larger quantity of sulphur salts thrown upon those portions. These causes combined, no doubt produced that difference which Mr. Smith had very truly stated. Here were the observations of a practical man pointing out where the decay took place, but he did not show them how the evil was to be avoided. Dr. Voelcker had shown them the chemical changes which took place in certain descriptions of stone, and in the case of the specimens of dilapidation exhibited this evening, it appeared that this destruction was going on while the restorations were in progress, so rapid was the decay in some instances.

WOOD SAWING AND SHAPING MACHINES.

AN invention has been patented by Mr. J. W. McCarter, of Londonderry, and is described with engravings in the *Engineer*. It comprises improvements applicable to machinery for sawing wood, and more or less to other wood-cutting machinery. Deal frames upon his plan are sawing thirty-two deals per hour, two being cut at the same time. The invention does not relate to the saws with their frames and guides. The first portion of the invention relates to an improved silent feed motion, the principal part of which is a disc fixed on a shaft driving the feed roller shafts. A second portion of the invention relates to improved rollers for carrying, moving, and guiding the wood through the machine, these rollers being so contrived as to dispense with the fence, side rollers, weights, and springs hitherto employed. — Another invention, by Henry Wilson, of London, is described as consisting in the construction of machinery whereby wood is shaped, either one piece or several pieces at one time, to the form of a metal or other suitable hard template or guide by means of rotating cutters, which act upon the wood in the direction of the grain, whereby a smooth and even surface is obtained. These inventions cannot be fully described without the aid of the engravings.

THE COTTAGES AT HARTWELL AND STONE, BUCKS.

A CORRESPONDENT urges that our informant "was misled in regard to the proprietorship of some of these cottages; for, although the acreage of the two parishes does principally belong to Dr. Lee, many of the cottages in question do not. Even where there is a row of connected dwellings," he goes on to say, "only a portion of these belongs to Dr. Lee. The doctor maintains a large staff of bricklayers and carpenters, whose duty it is, under the direction of an inspector, to enlarge, reinstate, or repair both farm-premises and cottages."

We are very glad to find that Dr. Lee's friends repudiate for him the ownership of the dog-holes at Hartwell, and that we were misinformed in that respect. All we will say is, that the people thereabouts should also be set right in their knowledge; for it was not one informant, but half a dozen informants, who gave us the

MONUMENT IN MEMORY OF CANON M'CARTHY, MALLOW, CORK.—Mr. J. J. M'Carthy, Architect.

statement in question. The condition of these "homes" of our labouring population no one defends: our sketches put that out of the question; and others that we shall probably give soon will further confirm all that has been said. It is to be hoped the real owners will see the necessity of attempting some immediate improvement.

THE M'CARTHY MONUMENT, MALLOW.

The monument recently erected in the parish church of Mallow, county Cork, in memory of the late Very Rev. Justin Canon M'Carthy, is composed principally of Caen stone, inlaid with spars and marbles of various colours. The effigy, which is life-size, is of alabaster; and the cresting of roof of wrought-iron, gilt. The total height of the monument is 11 feet. The entire work has been executed by the Messrs. Hardman, of Dublin, from designs by Mr. J. J. M'Carthy, R.H.A., architect, at a cost of 165*l*.

FRAMLINGHAM COLLEGE.

PRINCE CONSORT MEMORIAL FOR SUFFOLK.

In February, 1862, the country was full of the idea of memorials of the Prince Consort. On the one hand, the Central Committee wished to gather into one all the contributions for a great national object: on the other hand, each particular county and province, eager as the central body to perpetuate the memory and example of so great and good a man, was nevertheless desirous to see on its own soil the particular monument which might be erected.

In Suffolk, the idea of a cheap and good education for the sons of the middle classes soon gained ground. A county meeting was called, and 6,000*l*. subscribed on the spot. The Lord Lieutenant, who is identified with every movement for the good of the county, lent the weight of his influence, and the nobility and gentry rallied round him, and the list soon swelled to larger proportions; but a crowning feature was to be contributed by Sir Edward Kerrison. Belonging to Pembroke College, Cambridge, there lie at Framlingham and elsewhere sundry estates willed in the old times for educational purposes. After lengthy conferences with the Fellows of Pembroke, who were willing enough to devote a part of the disposable property for the benefit of those for whom it was intended, when only the method was decided, Sir Edward succeeded in gaining a plot of land for the site, and a Bill was passed in Parliament, at the instance of the Charity Commissioners, empowering the grant of fifteen acres of land as a site for the Middle Class School.

The subscriptions now amount to more than 13,000*l*., in addition to other benefactions; and Suffolk promises to provide for her less favoured sons a preparation for the very highest position for which they may be fitted by their genius or acquirements. To illustrate the spirit with which the movement has been inaugurated, the following have contributed 500*l*. each:—Lord

FRAMLINGHAM COLLEGE, SUFFOLK.—THE REVEREND C. [illegible]

radbroke (lord lieutenant), patron; Sir Edward errison, president; Sir Fitzroy Kelly, M.P.; rd Henniker, M.P.; Sir George Broke Middle- a; the Marquis of Bristol; Sir Charles Bun- ry; Mr. T. Lucas, Lowestoft; Mr. K. Wilson; . R. Garrett, Leiston; Mr. J. Berners; Mr. G. Mantle, Leicester-square. Mr. Goldsmith, rliament-street, gives 700*l*. Many other large scriptions swell the sum total to the above- ntioned amount.

The committee have laboured continuously to ng the undertaking into shape, and the build- , of which we give a view, is in course of erec- n at Framlingham. The edifice is designed the Gothic style, of a collegiate character, nped together in such a manner as to give ersity to the general outline, and is of con- erable extent, covering an area of 240 feet by feet; containing accommodation for head ster, four under-masters, officials, and 300 s.

The general elevation presents a central block uilding, with clock tower, and in this portion the building it is intended to denote the norial character of the edifice, by erecting a ue of the Prince Consort, in a canopied niche the entrance doorway. On each side of the ral building the college extends about feet, being three stories in height, and ning the residences of the boys and under- ters. At the west end of the college is placed head master's residence, and it is proposed rect at the opposite end a chapel for the use he students. The upper and lower schools in the rear at each end of the building, and of similar elevation as the front of the college. rary, lecture-room, and class-rooms, are pro- d for each of the schools. At the back of central building is the dining-hall, capable ccommodating 500 boys. Near the dining- are placed the kitchen, matron's and domes- offices, and, separate and distinct, an in- ary for sick boys.

e building is a red brick structure, and ns the summit of a hill: it has already ned the first story. It looks down upon rich ures, ending in a small flat tract, the re- s of the ancient moat; and on the oppo- slope is perceived the quiet old town, the fitting in every respect for an educational e, being connected by rail with every part e county, surrounded with classic remini- ces, and said to be eminently healthy.

is also free from the disadvantages of a population. The chief attraction in the cape, however, is the extensive circle of d fortifications, comprising the remains of ld castle.

e committee anticipate that the progress being made will enable them to open the ings about the Midsummer period of this

The architect, under whom the works are d, is Mr. Frederick Peck. The contractor . Lacey, of Norwich. The cost of the build- xclusive of chapel, will be about 13,000*l*.

is gratifying to observe that not only re- s in the county, from the Lord Lieutenant farmer, are heartily supporting the move- ; but even natives of Suffolk, whose for- have been made elsewhere, still take a in the county which gave them birth, and ckoned among the largest contributors.

E ARCHITECTURAL ASSOCIATION.

ordinary meeting of members was held day, the 22nd inst., Mr. T. Roger Smith in air.

following gentlemen were, on ballot, d members of the Association: Mr. Thomas , Mr. Thomas Wisedale, and Mr. F. H. ister.

J. D. Mathews (hon. secretary), in an- ing donations to the library, called atten- to the advantages which it offered to the ts of architecture, and observed that it e only lending library of the kind in the polis, and as such was entitled to the sup- the profession.

Chairman concurred with Mr. Mathews, pressed a hope that, should any member Architectural Association be so fortunate obtain the Society of Arts' prize for the sign for a labourer's cottage, he would his gratitude by a liberal donation to the .

Penrose then read a paper on Greek cture, which will be found in another

e conclusion,

Mr. Penrose stated, in reply to questions from Mr. Spiers, Mr. Blashill, Mr. Ridge, and other members, that the general impression was that the Parthenon (of which a coloured diagram, executed by the late Professor Cockerell, was exhibited) was coloured when it was originally built, and not at a later period when the Romans had ascendancy in Greece. There was no trace remaining of gilding in the Parthenon, but in the annals of the Erectheum records were still preserved to prove that gilding had been used in the ornamentation of the building. With regard to the roofs of Greek temples, there were places which seemed to have received scantlings of timber. It was believed that marble tiles were placed over the timbers, and that the rain-water was allowed to drip off. No cement was used in the pillars of the Parthenon, but the blocks of stone seemed to have been rubbed or ground down very fine, so as to make them fit exactly when set upright. There were also traces of iron and bronze cramps, but many of the latter had been stolen. He had not been able to discover any traces of masons' marks, so often found in ancient buildings in England and elsewhere.

Mr. Spiers having proposed a vote of thanks to Mr. Penrose,

Mr. Blashill, in seconding it, expressed his gratification at finding that Greek art had been popularized of late; and recommended all who desired to know more about the subject to attend Professor Donaldson's lectures at the London University.

The Chairman having put the motion, which was carried, said the Athenians at one time appeared to have reached perfection in architecture, sculpture, and literature. We could not hope to rival them in an age like this, when beauty in architecture was too often sacrificed to utility; but we might improve ourselves, and make our architecture more grateful to the eye by studying nature in landscape and in the human figure. He looked forward to a revival of architecture by the harmonious action of architects in favour of a general style and general progress. The works of Mr. Cockerell were amongst those which could always be studied with advantage, and he hoped the members of the Association would profit by them.

The Chairman then announced that as Mr. T. Hayter Lewis would be unable to read his promised paper on the 5th of February, on "French Architecture down to the Renaissance," Mr. Bunker had promised to read a paper on "The System of Measuring and Valuing in the Metropolis." The paper by Mr. T. Hayter Lewis would be read on the 1st of April, in lieu of that promised by Mr. Molecey, who was about to leave the country.

It was also announced that the subject for the next class of design would be "a library."

MANSFIELD STONE.

AT a recent *soirée* of the Mansfield Mechanics' Institution, held in the townhall, and presided over by the Speaker of the House of Commons, Sir Roderick Murchison, in the course of an address, drew attention to the structure of the county of Nottingham, and of the stone of the neighbourhood. He had before him maps prepared by the Geological Survey of the British Isles. That survey, of which he was the unworthy director, had in their possession maps so constructed as to represent all the younger formations and all the older formations which existed in the British Isles, and any person so disposed might obtain copies of them at a small price. With regard to that particular town (Mansfield), it rested upon a rock which was singularly interesting to himself, as he had occupied a very large portion of his life with the development of those organic remains which succeed each other in the crust of the globe. Mansfield stood upon the very highest of these formations, and next under it was the great carboniferous formation which was important to that district, inasmuch as it contained the only great mass of coal, and was superior to all other, or any other, of the younger deposits. The formation on which Mansfield stands, to which he had given the name of Permian, was of enormous importance to this county. It was so because it overlaid that great pabulum—it was the great feeder of the industry of our country; it was the great coal deposit of England. The question also was: to what depth could they find coal beneath the magnesian limestone? He gave the name of "Perm" to it for this reason:—Whilst travelling through the vast expanse of Russia, he there found, in the government of Perm and other vast regions of that kingdom—regions as extensive as the territory of France proper,—this deposit of which the limestone of Mansfield is the centre. This Mansfield limestone was of great, nay, of universal, importance in the structure of the globe. It contained the same organic remains in Russia that it did here, only in Russia it was disseminated in very small bands. Still it contained the same organic remains as those which are found in this country, and was surmounted, as well as underlaid, by great masses of red sandstone.

In this country, on the other hand, whilst the limestone was predominant, those great masses of overlying sandstone did not exist,—the deposit which overlies our limestone belonging to another age. The new red sandstone of Sherwood Forest, which immediately succeeds from Newstead Abbey, immediately to the east of Mansfield,—this Permian group or system was of immense importance when we considered the singular value which it possessed within itself, as being one of the finest building stones to be found within the British isles. Knowing how great was its value in this respect, he very much regretted that, when a scientific friend advisedly, and with great talent, recommended that this magnesian limestone should be used in the construction of the Houses of Parliament, the Mansfield stone was not selected in preference to that which was used. If the Mansfield stone had been selected, not one pinnacle in that otherwise grand building would have been subject, as it now was, to perish; not one of those sandy, yellow, incoherent beds, would have been selected by the contractors; or rather, he should say, that they were only too anxious to meet the wishes of the architect-in-chief, in getting large masses of stone, whatever might be their quality. Here he would tell them an anecdote, relating to his friend who recommended the Anston stone for building. His audience were aware that there were various qualities of the Anston stone. Well, there was an officer appointed, at a very small salary,—a person well calculated to select the stones which were only proper for the construction of our great Houses of Parliament; but, by one of those miserable pieces of economy which from time to time take place, this officer, whose duty it was to mark and send back such stones as were unfit for the purpose, was paid off, and the consequence had been,—he would say it in the presence of the Speaker of the House of Commons,—great deterioration in the structure of the Houses of Parliament.

THE "METROPOLITAN DISTRICT RAILWAY" BILL.

THE preamble recites—

"That the streets of the metropolis are inadequate to the wants of the vast and increasing population which now frequents them, and they are further encumbered by the passage through them of goods and minerals between railways having terminal stations in the metropolis, and it has become indispensable that they should be relieved of portions of that traffic, partly by the construction of railways within London, and partly by the construction of railways around the metropolis, which shall unite the railways having termini in London, and thus become a channel for the conveyance of goods and of minerals from one railway to another, and especially from those lying on the north to those on the south side of the Thames."

The project is set forth as a main outer circle, a main inner circle, and a series of branches connecting the outer circle with the following systems:—West London Extension; West End of London and Crystal Palace, Hammersmith and City; Great Western; London and North Western; Midland; Hampstead and City; Great Northern; Great Eastern; North London; Blackwall; Brighton; South Eastern.

The "inner circle" is to commence at the proposed extension of the Metropolitan and Brompton, and to pass by Westminster Bridge and along the north bank of the Thames to join another proposed extension of the Metropolitan near Fenchurch-street, thus completing a circle of railway in London which will communicate with, or be in close proximity to, all the stations in London north of the Thames.

The "outer circle" is to commence on the south side of the Thames by a junction with the Chatham and Dover, in the parish of Clapham, passing across the Thames between Chelsea and Battersea bridges, connecting itself with the main inner circle at Brompton; thence passing through Kensington, Kilburn, Kentish Town, Stoke Newington, Clapton, Hackney, and Bow; and ultimately from Bow across the Thames at

Rotherhithe, to join the South Eastern near New Cross.

It is provided in regard to that part of the outer circle which will lie between the Great Eastern at Bow and the South-Eastern at New-cross, that the construction of a bridge across the Thames at Rotherhithe, below London Bridge, should be deferred until the execution of the other portions of the undertaking shall have insured that the ultimate object of connecting all the railways around London will be attained. In order, also, to complete the system of intercommunication which is intended to be formed between the different railways, it is declared expedient that powers should be given to use short portions of the Brighton, of the London, Chatham, and Dover, and of the West London.

The capital is estimated at 10,000,000*l.*, whereof 4,000,000*l.* are to be borrowed.

The first members of the board are the Earl of Devon, and Messrs. Samuel Laing, George Worms, jun., Alderman Dakin, W. A. Wilkinson, W. Lee, W. Austin, Hon. F. Lygon. The works to be proceeded with are to be completed within seven years. The tolls for the inner circle are 6d. first-class, 4d. second, and 3d. third. Small parcels from 2d. to 3d.; exceeding 28 lb., 6d.; exceeding 56 lb., such a sum as the company may think fit. The tolls on the outer circle are to be 2d. per mile, and regulations as to the conveyance of cattle, coal, iron, and other merchandise are minutely described. The maximum rate of fares for passengers is fixed at 3d. per mile first-class; 2d., second; and 1½d., third. The company is not to be compelled to carry manure on the inner circle.

RESTORING STATUES AT LINCOLN.

THE newspapers say, the reparation of the Cathedral at Lincoln is being steadily proceeded with, by Messrs. W. & J. Sandall, under the direction of Mr. C. Ward, architect. The eleven figures of early English kings will be thoroughly restored. "A portion of the Norman work at the sides of the entrance is very much decayed, and this also will be restored, the new work already executed consisting of grotesque heads and angular tooling." This sounds very alarming. We offer no objection, in the absence, at present, of precise information; simply a caution to those who are concerned.

THE ARTISTIC SOCIETY OF PAU, FRANCE.

THE president of the Society "*des Amis des Arts*," of Pau, asks us to make known to English artists that their exhibition will open on the 15th of March next, and that they would gladly receive works of art from England. We willingly do this. Pau is occupied during the winter by many English families, who would be pleased to see works of their countrymen in the exhibition. Purchases are made by subscription, and allotted as prizes. Some copies of the programme will be found at our office, 1, York-street, should any English artists feel disposed to forward works to Pau.

SANITARY STATE OF MARYLEBONE.

FROM the monthly report on the health and climate of St. Marylebone during December, 1863, by R. D. Thomson, M.D., F.R.S., medical officer of health for the parish, printed by order of the Vestry, it appears that the health of the district has been more favourable than in the preceding month, since 356 deaths are recorded in the *five* weeks of December, and 305 in the *four* weeks of November. There were twenty-four fever cases in the past month contrasted with twenty-one in the four weeks of November. The disease, however, continues the report, "is increasing in the eastern districts of the metropolis; and it is necessary to be prepared to provide for the isolation of the sick in such a contagious complaint, should it make its way among our own population during the severity of the winter. From the total want of sufficient means of isolating epidemic and contagious diseases in the public hospitals, and from the increasing density of the population of the metropolis,—the most frequent cause of the spread of contagious disease,—the local authorities must, in future, make up their minds to provide for a certain number of sick during the prevalence of infectious zymotic disease. It is to be hoped that the larger and more wealthier hospitals will see fit to provide distinct isolated wards for contagious disease, as is universally the case in country infirmaries. If this desideratum be not supplied, these institutions will, in a great degree, be superseded by parish infirmaries and dispensaries."

THE NEW WORKHOUSE AT CARLISLE.

THOUGH not altogether completed, this workhouse has been opened to the public for inspection. The building is in the Italian style of architecture, of red brick with white stone facings. Above the main entrance, and between two lofty ornamental turrets, is the clock with transparent dial. The first apartments on the right and left are the master's office and parlour, and at this point the house is equally divided for males and females by a passage running through to the dining-room, which is 70 feet by 30 feet, and will also be used as a chapel. Throughout the whole length of the building, on each story, runs a long corridor 250 feet in length. From these corridors the various departments branch off. The right half of the building will be devoted to the females, and the left to the males; and on both sides the arrangements are uniform from bottom to top. The infirmary adjoining the house is a large building in the same style as the main building. The architects are Messrs. Lockwood & Mawson, of Bradford. The following were the tenders for the work, selected from fifty-nine sent in:—Messrs. Armstrong, excavating, brick-work, and masonry, 5,407*l.*; Court, joiner, 3,111*l.*; Irving & Lowthian, plumbers, 690*l.*; Johnston, plasterers, 618*l.*; D. Clarke, ironfounder, 429*l.*; Hill & Sutcliffe, slaters, 681*l.* 10*s.*; W. Stephenson, painter, 259*l.*; making a total of 11,195*l.* 15*s.* The glazing was done by Messrs. Slee & Morgan. The architect's estimate was about 12,000*l.* The total cost of the land and building together will amount to 12,715*l.* 7*s.*, to be paid off in twenty-one years, and involving a rate of 1¼d. per pound per annum.

LONDON FIRES DURING THE PAST YEAR.

THE annual report of the superintendent of the London Fire-Engine Establishment deserves attention. In the year 1863 the number of alarms given at the various stations of the metropolis alone was 1,624. Of these 81 were false, 139 proved to be only chimney alarms, and 1,404 were fires; of which 39 resulted in the total destruction of buildings, &c.; 310 in serious damage; and 1,055 in slight damage. The fires of 1863 show an increase, compared with those of 1862, of 101; and compared with the average of the previous thirty years, the increase is 582. This is an enormous increase, which is not to be accounted for by the increase of population and buildings. The report, however, shows that in the management of fires there is an improvement. The totally-destroyed list, 39, compared with that of 1862, shows an increase in number of six; but compared with reference to the average population of the thirty previous years, there is a decrease of nine. The amount of total destruction will, we hope, decline, as the facilities for telegraphic communication are in more complete working order between the various districts and the fire brigade stations, and through the general introduction of the steam fire-engines: but the figures which follow show that a considerable portion is caused by the distance between the suburban districts and the stations; for of the buildings destroyed, 4 were over 2 miles from the nearest station, 7 over 3 miles, 1 over 5, 2 over 6, 2 over 7, 1 over 8, 1 over 11, and 1 over 12 miles; 3 were lost from want of water, and 1 fell down before the fire was extinguished. We thus learn that a great part of the thorough mischief is done at a distance of about 3 miles from the stations at present established.

Of the 39 totally burnt-out buildings, 18 were completely alight, and 17 others burnt down, before the arrival of the engines. It is said that the telegraphic communication between the chief station and the outlying ones,—a plan which we recommended years ago,—has been completed; and now we urge, not only the erection of fresh stations, but telegraphic communication in case of fire throughout the part where the total burning is the most rife.

Than the men and officers of the Metropolitan Fire Brigade, there is no class who with so much energy and so much risk devote themselves to their important duty. They have also to contend against damp, and at all hours with the changes of temperature. In 1863 the list of casualties to firemen was less than in the previous year. There have been eighty-six cases of illness, totally incapacitating the men from duty, against ninety-eight cases for the year 1862; but although less in number, more severe in character. Of the total number, thirty-three have arisen from accident, and several are of a very severe form, demonstrating the hazardous nature of their employment. Respecting these men, who are not very well remunerated, and who, in consequence of the risk, would find difficulty in insuring their lives or providing against sickness, Superintendent Shaw says, "At the close of another year it has become my pleasing duty to bear testimony to the general efficiency and excellent conduct of all ranks of the establishment, and to state my most sincere belief that the steadiness, unanimity, fearlessness, and zeal, with which they devote themselves to the arduous duties of their profession, fully entitle them to that confidence and liberality of which they receive such numerous instances at your hands."

The figures, in connexion with other large cities are worth note, although the accounts of some of those abroad may not be quite exact. Average per annum:—Philadelphia, 363; New York, 331; Paris, 300; Berlin, 260; Hamburg, 244; St. Louis, 189; Boston, 172; St. Petersburg, 140; Montreal, 104; Brooklyn, 83; Troy, 42; Charleston, 31; Liverpool, 297; Manchester, 238; Glasgow, 221; Dublin, 174; Birmingham, 127; Sheffield, 51; Leeds, 47; Hull, 26; Bristol, 25; Cork, 23; Sunderland, 22; Belfast, 17; Birkenhead, 8; York, 11; Exeter, 10; Waterford, 5; Yarmouth, 4; Tynemouth, 3; and in London, as we have above recorded, 1,404.

Hodges's Fire Brigade.—An elaborate report has just been published, containing statistics as to the number and character of fires which have been, as usefully as disinterestedly, attended by the fire brigade maintained at the expense of Mr. Hodges, the distiller, of Lambeth; from which it would appear that the public are greatly indebted to that gentleman and the men under his command. During the past year the total number of fires attended was 108; whilst in 1862 they only amounted to sixty. Of the former, eighty-four took place on the south, and twenty-four on the north side of the Thames. Two steam fire-engines, the "Torrent" and the "Deluge," have been added to the plant of Mr. Hodges's fire establishment, and have proved very effective. 2,200 feet of hose, and other appliances, are kept in thorough repair, and in readiness at a minute's notice. He has also purchased from Mr. Salt, of Saltaire, a steam road locomotive, called the "Fly-by-night," which runs at the rate of 12 to 20 miles an hour, according to circumstances, and is worked by two men, and capable of carrying twenty persons. Notwithstanding the useful services which Mr. Hodges and his fire brigade appear to render to the metropolitan public, it is to be regretted (as a correspondence published in conjunction with his report intimates) that he has grounds of complaint of want of courtesy, as well as obstruction received at the hands of the authorities and *employés* of the London Fire Brigade, at a time when the most determined energy and unity of action are necessary to prevent the destruction of valuable life or property.

ANOTHER NOTE ON THE ANCIENT WELL AT CLERKENWELL.

FROM time to time we have adverted to the desirability of preserving one of the most interesting old London landmarks,—a spot from which a parish containing a population of 65,68 persons has taken its name. The important in days long gone by, of this ancient site, has been more than once referred to in our pages; but without now repeating the details, it may be mentioned that notices of the site of this well fill many pages of old London history: kings and queens have come here in pomp, attended by courtiers, who little thought of underground or other railways passing close by; and by which even stage coaches and stage waggons would have been looked upon as fabulous things suggested to them.

Wishing anxiously for the preservation of historical sites of old London, we keep striving to force those who are in duty bound to do so to restore those landmarks which are in danger of being forgotten or of perishing by decay, especially to cause those who have wilfully neglected or misappropriated such relics, to be

.ck what has been wrongly removed, or to re-
ore those memorials which have been wrongly
dowed to go by neglect and to decay.

In furtherance of these intentions we quote
om one of an interesting series of papers on
e Clerkenwell charities in the *Clerkenwell*
ws. It is clear, as we have said before, that
e Marquis of Northampton *left by gift* to the
or of Clerkenwell, in 1674, Clerk's Well in
-y-street, &c., at a peppercorn rent; also a
hall room at the back of the pump, let to a
r. Giles at 2*l*. 12s. per annum.

"The following extract from the vestry minutes of 167[illegible]
ows the means by which the parish became possessed
the well in Ray-street, and the purposes for which it
s given, together with the manner in which it was after-
rds disposed of by the vestry :—

"It was unanimously ordered by the ancient inhabitants
the parish met in this vestry (Dec. 1671) That whereas
Right Hon. James, Earl of Northampton, hath given
rtain spring of water for the use of the poor of the
d parish of St. James, Clerkenwell, during his lord-
p's pleasure; and whereas the parishioners have
ught fit to let out the said spring of water for the
nefit of the poor of this parish to such person or persons
o will give the most or greatest rent, or annuity, or
ome, for the same; and whereas John Crosse, of this
rish, brewer, hath offered to give a greater rent than
r other person, out of charity and goodwill to the poor
the said parish; we, whose names are hereunto sub-
ibed, have therefore thought fit to order that the pre-
it churchwardens do let a lease for twenty-one years of
said spring of water to the said John Crosse, for the
t of 40*s*., one moiety whereof to be paid at Midsummer,
next moiety at Christmas following, and so yearly to
churchwardens for the time being, during the term,
the use of the poor.'

Mr. Pascall says,—'I am here induced to remark that,
r the free gift of the spring by the earl to the use of
poor, it was not very generous on the part of the
try to take it from them and let the same on a lease
twenty-one years for the sake of getting forty shillings
ear, of which most probably the poor never had a
thing.'"

We still hope that the vestry will move for the
urn of the memorial which stood upon the
e of the well. It is undoubtedly the property
the parish, and of much public interest; and
is stated that this record of the ancient well
n the possession of a member of the vestry of
rkenwell.

HOLBORN VALLEY.

At the last meeting of the Court of Common
uncil, a petition was presented by Mr. F.
rrable, architect, praying that his letter to the
mbers of the corporation on the subject of the
mniated designs for the improvement of
lborn valley might be taken into considera-
n. The petitioner, it appears, considers him-
aggrieved by the decision to which the com-
tee intrusted with the examination of the
eral plans arrived, and which he believed was
tually influenced by the engineer consulted by
m. The petitioner therefore prayed that the
n of Mr. Bell, to whom the first prize of 250*l*.
s awarded, and that of Mr. Sorby, who received
e second prize of 150*l*., might be submitted to
e scrutiny and judgment of some professional
n or men of the highest eminence, free from
predetermined view on the subject, and who
uld be able to decide without prejudice or bias
ether these designs were in accordance with
e conditions of the competition expressed and
plied as regards the accuracy of the estimates
the practical working of the gradients and
ls, and which of the designs, including his
n, was best calculated to meet the public con-
ience.

n the course of the discussion that followed
was stated that Mr. Haywood had received
00*l*. for his services in going over the compe-
on designs and for the preparation of plans
e deposited in Parliament.

he petition was ultimately rejected by a large
jority.

COMPETITIONS.

Public Cemetery for Manchester.—From the
eteen sets of designs received in answer to
blic advertisement, the three premiums which
been offered for plans for laying out and
mining the land, and designs for the chapels,
rance-gates, and other buildings required for
proposed public cemetery, have been awarded
he designs sent in under the following mono-
n and mottoes, viz.:—"Trefoil in an Octa-
," 100*l*.; "Père la Chaise," second, 40*l*.;
"Hoc Signo," the third, 20*l*. The sealed
elopes relating to such plans were, subse-
ntly to such decision, opened; when it ap-
ed that the plans obtaining the first premium
been sent in by Messrs. Paull & Ayliffe,
nitects, India-buildings, Cross-street, in con-
ction with Mr. William Gay, landscape gar-
er, Bradford. The plans obtaining the second
premium were by Mr. Henry Littler, 1, Albion-place, Higher Broughton; and those obtaining the third premium were by Messrs. Lucy & Littler, of 9, James-street, Liverpool.

PROVINCIAL NEWS.

Bristol.—The Government, in reply to a memorial signed by upwards of seven hundred of the principal merchants, bankers, and others, have consented to erect a new post-office, money-order office, and savings bank, for this city, at a cost of 10,000*l*., provided the citizens will contribute the sum of 2,000*l*. towards such outlay, subscriptions having been made by other cities and towns where new post-offices have been erected.

York.—The Inspector of Prisons who visits York has intimated that a communication will shortly be received from Sir G. Grey, the Home Secretary, requesting various alterations and improvements to be made in the House of Correction. These alterations will have principally for their object the adoption of the silent system; and the estimated cost, according to the *Intelligencer*, is about 3,000*l*. This expense, if incurred, will be defrayed by the ratepayers of York. In case the requirements made are not fulfilled, the inspector threatens that the prison will have to be closed.

ARCHITECTURE AS A FINE ART.

When we fail in any undertaking whatever, we do not usually content ourselves with mere endless repetitions of the attempt. But if after very great changes in the conditions we still fail, the suspicion will creep in that our whole process is faulty. Possibly we begin wrong, and so cannot possibly succeed. We and our neighbours have copied the Classic, Gothic, &c., and now are completely at sea, without any style at all: see Mr. Fergusson.

The usual practice seems to be to design an *outside* first, and then to squeeze an inside into it. Thus the inside is often sacrificed to the out. As such a proceeding produces no good result, let us reverse this process, and in all cases design the *inside* first. Modern wants would then by degrees mould or form a style. The true architect would be he who succeeded in making an internal want sightly. In his lecture on this subject, Professor Smirke approves of the judicious use of "accident" in producing the picturesque; but no internal want ought to be talked of as accidental. The architect is called on to provide for those wants,—if possible with beauty, but on no account to stunt them like a clumsy shoemaker.

R. T.

Athenæum.

THE COMMITTEE OF THE ROYAL HOSPITAL FOR INCURABLES.

TREATMENT OF ARCHITECTS.

Sir,—Nearly three years ago the Board of the Royal Hospital for Incurables applied to some half-dozen architects and myself to send them designs in competition for their new hospital, to be erected near Reigate. Their letter of invitation informed me that the building would be in accordance with instructions furnished, which stated among other things that the Board contemplated an expenditure of about 30,000*l*.

After informing the Board that the prizes (73*l*. 10s. and 31*l*. 10s.), were no inducement whatever to me to compete, and eliciting from them in reply a distinct assurance that it was their intention to employ the successful competitor in the erection of the building, I consented on this condition alone, and little suspecting the real state of the case, to send in designs, which, with those of the other competitors, were reported upon by Mr. Bellamy; and on the 19th December, 1861, I was informed that the first prize had been awarded to me, and that the drawings were on view to subscribers and others.

Since that time, though the Board have retained my designs, and even applied to me for a perspective view of the building, I have received no communication from them except in reply to letters addressed to them; and it now appears that they have never possessed the 30,000*l*. named in their instructions as their contemplated expenditure, nor do they appear to have ever had any definite prospect of being able to build their new hospital.

Having recently seen by advertisements that the Board have purchased an old building, and have accepted plans for its alteration, without any communication with me, I inquired whether they had abandoned the idea of erecting a new hospital from my designs, but have not been able to get any satisfactory reply to this reasonable question.

Architects are unfortunately not unaccustomed to want of courtesy and fair dealing in open competitions, but I think the competitors in this case had a right to expect that the Board of a respectable and useful charity, with such a man as Mr. Henry Huth as its treasurer, would not have sought to obtain from professional men, by a promise of something which it was out of their power to give, designs for a building for the erection of which they were fully aware no funds were available.

Edward M. Barry.

*** Is not this a case which might usefully be confided to a lawyer, with the view of teaching committees that they have duties as well as rights?—Ed.

CANONS, NEAR EDGWARE.

John Freeman, Esq., of Fawley Court, in A.D. 1748, purchased the pews, pulpit, altar, and font of the chapel of Canons, and with them fitted up his parish church of Fawley. At the same time he modernised the windows and doorways of the church. The seats are arranged choir-wise, facing north and south. The carving is by Grinling Gibbons.

Fawley is in the county of Buckingham, and about three miles from Henley-on-Thames. The pulpit and stalls are still to be seen, unless the church has been restored within the last twelve months.

E. J. Payne.

A SUGGESTION AS TO THE SO-CALLED "ACOUSTIC POTTERY."

My attention has been directed to some correspondence, accompanied by an illustration, in your columns bearing the mysterious and rather incomprehensible title of "Acoustic Pottery." Though a careful description is given of the whole arrangement, there is not the slightest suggestion as to *how* these jars are supposed to have aided in the acoustic effect, nor any reference to known laws on the transmission of sound. Of course every one knows that earthenware pots share in common with all hollow vessels the power of developing sound to a wonderful degree, but I have never noticed in any crockery-shops that the empty pickle-jars conduced in any way to produce unusual acoustic effects; and it is difficult to understand how, if those exposed on the shelves failed in this respect, that the jars under the counter or down in the cellar were likely to have assisted much.

Now this seems to be the case as regards the position of the jars discovered in the churches at Norwich: they seem to be built into walls at the side of a narrow channel, like an open drain, under the seats of the choir, and were of course covered over by the floor of the stalls. Is it to be supposed that the voices of the choir went by some mysterious means straight down through an oak floor, entered the jars, were developed there somehow, and then issued out in a grand solemn body of sound and filled the whole church with its volume? This may have been so, and as I do not know much about acoustics I should only be too glad if any one learned in the science could explain it. In the mean time I would venture to offer a suggestion, viz., that the arrangement is neither more nor less than a fifteenth century *heating apparatus*. Both the arrangement and the position seem to favour this idea. If a little charcoal were placed in each, or even in alternate pots, the draft in the flue would have the effect of keeping it burning for a long time, and the warmth generated thereby, and ascending through perforations in the floor, would of course be very grateful to the occupants of the stalls during the services of the church. The fires, when once kindled, would keep in at the least for twelve or fourteen hours without any touching, and could at any time be easily replenished. Of course a flue from the chambers would greatly accelerate the draft; and some such flue may possibly have existed, the remains of which may have been destroyed during the subsequent alterations.

One of the churches in Peterborough is, I am told, still heated by an apparatus somewhat similar, invented and patented many years ago by some ingenious person, whose name I cannot at this moment find out.

In this case there are six pits like little cesspools, about 1 foot 6 inches square, and 2 feet

deep from floor level. They are placed at nearly equal distances over the church, are built of fire-brick, and covered over level with the floor by a cast-iron plate. These chambers are connected by a fire-brick channel or flue, passing from one to the other, laid immediately under the paving, and consequently about 15 or 18 inches above the bottom of the fire-chamber. The last pit of the series communicates with a common vertical flue in the wall; a certain quantity of fuel being placed in each of the pits, the one next the flue is lighted, and allowed to burn up a little, so as thoroughly to warm the flue; the others are then lighted in rapid succession, and without any trouble, as the first fire acts as a pilot stove. The fires are then allowed to burn gradually down, lasting about twenty-four hours, the result being that the church is thoroughly warmed.

We have here almost identically similar apparatuses. In the one case, the pots are small and many; and in the other case, the pots are large and few.

Mr. Phipson says, that when the pots at Norwich were discovered, there were no remains of any kind in them. When the fires are burned out in Peterborough, there is hardly anything left in the pits, the strength of the draft having carried away the particles of consumed fuel.

It seems curious that such an arrangement, very peculiar in itself, and very unusual, should be found in two churches in the same city, and nowhere else; for we do not hear of any of your correspondents ever having seen anything like it except at Fountains. This certainly seems to open the way to the idea that it must have been the invention of an individual; and that possibly the plan having proved troublesome, and not very satisfactory in its results, it had soon ceased to be used, and of course, from its position, forgotten. Possibly it may have been the first of a long line of heating schemes to which the people of this country have, during the last few years, been constantly falling victims. To judge from the illustration, it must, at least, have had one merit, not generally possessed by most of our modern contrivances, viz., it must decidedly have been cheap, even if not very effective.

R. NORMAN SHAW.

IMPROVEMENTS IN "CLOSETS."

MESSRS. READE & HEWITT, of Liverpool, have patented an invention for regulating the supply of water to water-closets, which they call the Pneumatic Vessel. The object of it is to prevent a waste of water, and to obtain a perfectly regulated supply, whether the head of water be 8 feet or 200 feet, and whether the cistern be immediately overhead or at a distance from the closet: thus, with pan closets, meeting all the exigencies of site which can occur in any building. The regulating valves now frequently used the inventors consider to be very imperfect pieces of mechanism, and not even equal to the old-fashioned cistern-valve with cranks and wires. The pneumatic vessel, when applied to pan closets, is placed in a recess in the wall behind the wood casing, and about 6 inches above the seat. A disc service-valve is contained in the bottom of the vessel, with a spindle working through a stuffing-box and guide eye, and secured by a joint to a connecting-rod, the other end of which is attached to a weighted lever. The whole apparatus is fixed to a board in the manner of an ordinary force-pump. By moving the connecting-rod of valve nearer to or further from the fulcrum of the lever, the waterway can be enlarged or diminished to suit the pressure; so that if the rod is attached to the lever by the hole nearest the fulcrum, the weight on the lever will keep the valve balanced against the highest pressure from the main; and, on the contrary, if the rod is moved to the hole furthest from the fulcrum, the waterway is enlarged and allows a free flow at low pressure, which is much assisted by the valve opening into the bottom of the vessel instead of in a bend of the pipe, as is usually the case. Out of the side of the vessel, near the bottom, a ¾-inch syphon service-pipe is carried above the top of the vessel, the longer leg entering the basin in the ordinary way.

At the top of the vessel is a floating air-valve, formed of a hollow indiarubber ball, 2 inches diameter, resting on cross-wires, which, when the vessel is full, is floated up against a brass bell or seat, from which a ½-inch air-pipe is carried to a hole under the flush rim of basin. The action may be explained as follows:—On the handle of the closet being lifted, the water flows through the service-valve into the vessel, rising level in the syphon-pipe, the air contained in the vessel escaping by air-valve and pipe. When the water reaches the floating ball, it rises and closes the bell orifice of the air-pipe, and then rising in the syphon, delivers into the basin the water flowing, and the vessel keeping full as long as the handle is held up. On the handle being dropped, the air re-enters the vessel by the air-valve, and the contents are syphoned out into the pan, forming the after supply. It will be seen from this that no water can flow into the basin until the vessel is full, and that it syphons itself empty when the service-valve is shut. In conjunction with this apparatus a high-pressure cistern, which is a part of the patent, may be used, and in some situations would prove of great utility, as it, as well as preventing a waste of water, containing only sufficient to once flush the closet, accumulates and utilises the pressure from the main, which is dissipated by an open cistern, and discharges its contents with great force into the basin, on the service-valve being opened. When the water-supply is constant from the main, this cistern is likely to be patronized by the water companies, no regulating cistern having before been contrived for pan-closets, the after-supply forming a difficulty not readily surmounted. The cistern acts by compressed air, but it is well known that the air contained in a close vessel at high pressure, becomes rapidly absorbed by the water. This is one of the defects of fire-engines, the air-vessel becoming water-logged; and in hydraulic rams a provision has to be made by a capillary tube, called a sniffling-valve for the renewal of the air on the return stroke. The high-pressure cistern possesses an inlet air-valve, by which the air is renewed each time the closet is used, thus sustaining its elastic force, and preventing its destruction by frost. The pressure due to the head of water is retained in this cistern, even though it should be supplied through 200 or 300 yards of ¾-inch pipe. The orifice of the supply-pipe is not more than ½-inch bore, and one cistern would work a dozen closets, thus effecting a great saving in piping, both for the supply and service. The apparatus is on view in Liverpool.

BRICK CROSSINGS.

WILL any of your correspondents inform me, through the *Builder*, in what town street-crossings are laid in with bricks, of what kind of bricks, their durability in metalled streets where the traffic is constant and heavy; also average cost per superficial foot or yard?

A SURVEYOR.

THE LEVERAGE OF TOOLS.

SIR, Probably some of your readers may at some time or other have had occasion to use a screwdriver, a carpenter's tool which everybody knows; and I probably they have found by experience that a long driver has far more power than a short one: the longer it is (providing its dimensions do not exceed such limits as to make it otherwise than a "handy tool"), the greater is the power with the same force at the extremity in proximity to the hand.

The same practical result is arrived at with a "borer." For instance, suppose a man had to bore a hole through a piece of timber, or to increase the diameter of a perforation in a piece of iron, he would do it with greater facility with a borer 2 feet long than with one only half the length.

Can this proportionate power be reduced to figures?

F. B. B.

COST OF "QUANTITIES,"

CHELSEA WORKHOUSE ADDITIONS.

SIR,—Will you inform me whether it is usual for a surveyor to charge 3*l.* 3*s.* for a copy of quantities, besides 1½ per cent. on the amount of contract? The architect of Chelsea Workhouse additions has done this, and will not return the 3*l.* 3*s.* to the competitors, eleven in number, whose payments make a sum of 34*l.* 13*s.*

ONE OF THEM.

COMPENSATION CLAIMS.

A CASE of some importance occupied Mr. Under-Sheriff Burchell and a special jury nearly the whole of Thursday, the 21st, at the Sheriffs' Court, Red Lion-square, on a claim made by Mrs. Desormeaux, of the Northumberland Hotel, Northumberland-street, against the Charing-cross Railway Company, for obstructing her business through the "block-up" by their works. Mr. Hardinge Giffard and Mr. Maclaughlin were for the claimant; and Mr. Lloyd, Q.C. (Mr. Shield with him), for the company. The house being situate at the corner of Northumberland-passage, was some way from the railway works, but they had caused the obstruction. It was admitted that for pulling down Hungerford Market no compensation could be claimed, but only for the obstruction to the business by the railway works. It was alleged that the traffic was likely to return through the passage. The business had fallen off, and a tunnel had lately been opened near the spot. Mr. Giffard said it was a nice question whether a market could be abolished without an Act of Parliament. Mr. Lloyd said if a large sum were awarded the case might give rise to a number of claims, and it might be taken to the Court above whether the present claim came within the Act of Parliament. The Under-Sheriff placed the case before the jury, and at five o'clock they awarded 300*l.* damages.

CASES UNDER THE METROPOLITAN BUILDING ACT.

PUBLIC BUILDINGS AND POLICE MAGISTRATES.

An important decision under the Building Act was made in the Court of Queen's Bench, last Wednesday, 27th inst. (the Queen *v.* Carruthers), as regards the bearing of the 30th section on public buildings, the subject being a church now building at Hackney. It appears, that Mr. Legg, the district surveyor of West Hackney, has held the opinion that this 30th section, instead of exempting public buildings from the prescribed rules of construction, imposes all these rules, and, in addition thereto, whatever else the district surveyor may consider necessary, subject to reference to the Board of Works.

The architect of the church, Mr. Edward Hakewill, himself a district surveyor of long standing, on the other hand, has always held and acted on the assumption that this 30th section freed public buildings from all the rules of construction, throwing the responsibility on the district surveyor, subject to the reference to the Board, in case of disagreement between him and the builder.

Acting on this, which is certainly the grammatical reading of the section in question, the builder of the church, Mr. Carruthers, having previously deposited with Mr. Legg the drawings of the church, proceeded in June last to dig trenches, fill in the concrete, and commence the walls, during which time Mr. Legg simply drew attention to the fact, that the footings of the walls were not twice the thickness of the walls; and Mr. Hakewill, in reply, contented himself by showing that they were constructively sufficient, and reminding the district surveyor, that in case he was not of that opinion, reference should be made to the Metropolitan Board of Works.

Thus matters went on till the walls were about 7 feet high, when the district surveyor took the matter, not to the Metropolitan Board, but to the police-court; and the magistrate, not seeing his own way to a jurisdiction, gave an order in accordance with the district surveyor's requirement, that the footings should be made twice the thickness of the walls, with costs.

This was at once appealed against on the part of Mr. Hakewill, and as the courts were not then sitting, the judge of vacation issued a writ of *certiorari*, to remove the case to the Queen's Bench, allowing the works to proceed in the interim.

A rule *nisi* was granted on the 12th November last, which was argued against at great length by Mr. Lush, Q.C., on the 20th inst.; but the judges unanimously decided that the order of the magistrate was erroneous and must be quashed, and gave judgment accordingly. Mr. Addison appeared for Mr. Hakewill.

In the course of the argument,—

Mr. Justice Blackburn observed that it might well be that the Legislature had refrained from placing public buildings under the jurisdiction of police magistrates. Such a jurisdiction, for instance, might press very hardly upon an architect of eminence who departed somewhat from the ordinary rules of the profession—as, for example, in the case of Sir Christopher Wren in the construction of St. Paul's.

The Lord Chief Justice said the clause which referred to public buildings gave an appeal to the board, but no power to magistrates to enforce the order; and public buildings, as regarded rules of construction, were excluded from the operation of other clauses giving the magistrates that power. Now, certainly the manner of making a wall was a matter of "construction;" and so, without straining and almost perverting the terms of the Act, the matter in question could not be brought within the jurisdiction of the magistrates. It was only as regarded matters not of construction that public buildings were under such jurisdiction. It might be that there was an omission in the Act as to the means of enforcing the requirements of the board as to the construction of public buildings. But whether it was an omission or not, there was no such power in the Act, and therefore the order was without jurisdiction.

Books Received.

Letter on Corpulence. By WILLIAM BANTING. Harrison, Pall-mall. 1864. Third edition.

LETTERS to the public recommending some individual medical attendant are little better than professional puffs; but we must do Mr. Banting the justice to state that it was not till his Letter to the public had reached a third edition that he published the name of the medical man to whom he attributes his cure of corpulency. He had published or distributed his first two editions gratuitously; but, finding his correspondence on the subject becoming rather troublesome and expensive, he issues the third edition at cost price (6*d.*), and, to save trouble, names his physician. However, Mr. Banting is evidently in downright earnest as to his extraordinary cure; and he publishes the simple principles of regimen on which it was effected. Our readers may recollect an article in our columns on "Popularizing Physiology," based on a popular little treatise by Dr. Lawson, Professor of Physiology at Birmingham College. In that article, as in the book noticed in it, the subject of fat, and its connexion

ith the liver and with saccharine and starchy od material, was treated of. Now, Mr. Bant- g's case is one of notable scientific importance e bearing upon this subject. It is by avoiding od of the kind just indicated that he has dimi- shed his corpulency; reducing his weight from 12 lb. to 156 lb., or by the very material quantity 46 lb.; diminishing his waist girth by 12¼ shes; enabling him to go down stairs like ier people, and not backwards, as he used to ; and also to tie his shoe-strings, &c., which many years before he could not do; and so . The food which he especially avoids is tter, sugar, potatoes, milk, and beer. He now es chiefly fish, except salmon; butcher's meat any sort, except pork; any vegetable except tato; any kind of poultry or game; fruit; and toast, &c.; so that he is by no means an bhorite, and he does not even stint himself in antity: it is the quality of food which makes the difference.

Mr. Banting's is a very instructive case, and pamphlet may do much good in such cases, well as in the reverse process, where a little re fat is desirable. The idiosyncratic action the liver, however, has doubtless much to do h differences of attainable result in different es of both kinds.

Might not that terrible modern scourge, "fatty eneration of the heart," which cuts off pre- turely so many valuable members of society, greatly mitigated, if not often cured, by Mr. ting's simple plan. He himself, and others b have imitated his example, have been cured alpitation, which is a concomitant of this ad disease.

Due to Railway Compensation, the Value of States, and Parochial Assessment. By Thos. ORRIS. London: Simpkin, Marshall, & Co. 863.

DENTS and others desiring to get a first no- of the mode of making and maintaining ms for compensation for damage done by ways, or for property taken away, may ob- it from Mr. Morris's little book. They t not, however, stop here. A little know- e in this particular case is a very dangerous g; and they must apply themselves to more plete and elaborate treatises on the subject, re they attempt to meddle either with the rests of others or their own.

Miscellanea.

IE NAIL TRADE.—The horse-nail makers in Dudley and East Worcestershire district given notice that, unless they receive an ance of 3d. per 1,000, they will give notice an advance of 6d. Other classes of nailers also notified their intention of claiming an ance.

HE ACME OF UGLINESS.—Sir: If any one is ous of seeing the most frightful thing that et been perpetrated in the way of drinking- tains, he will find at the corner of the ware and Marylebone roads such a concen- ion of ugliness as will equal his most san- e expectations. I am aware it has been ed some little time; but it is surely never ate to protest in the name of public taste, h is damaged greatly by all such erections.— . S.

GRESS OF DUMBARTON.—According to the barton *Herald*, the increase in the popula- of this town during the past twelve years been at the rate of 100 per cent. It now ains 721 more dwelling-houses and places of ess than in 1851. The rental is greater by 87. About 220 vessels have been built at yards in the town, the estimated cost of h was 3,275,445*l.* The annual quantity of consumed in 1851 was 1,635,300 cubic feet: now 6,714,000, being a yearly increase of 3,700 feet. Within the same period the in- tants have been supplied with an efficient e establishment; water has been intro- d; the lighting of the town has been im- ed; the river has been deepened; the public ion has been embanked at a cost of several sand pounds; four new churches have been ed; the slaughter-house has been removed de the town; a public cemetery has been ed; a new academy and public hall are to be erected; a thorough system of d drainage is shortly to be gone into; and balance to the credit of the corporation is rds of 3,000*l.* greater than it was twelve ago!

METROPOLITAN BOARD OF WORKS: THE CHAIRMAN'S SALARY.—On the motion of Mr. Tite, the salary of Mr. Thwaites, by a majority of 27 to 4, has been raised from 1,500*l.* to 2,000*l.*

THE SHAKSPEARE COMMITTEE.—It will be seen that the Site and Monument Committee are to meet next Friday (the 5th of February), and that artists and others desiring to make suggestions bearing on the desired result, are invited to forward them to 120, Pall Mall. The meeting is to be held at the house of the Right Hon. W. Cowper, M.P. A public meeting will probably be held as soon as the above committee have reported so as to inaugurate a general subscription.

WOBURN BEDS.—Some excitement has existed in this town for a few weeks, owing to the threatened demolition, and re-building, of the parish church, which is described as a very "pretty" building, erected by the last Abbot of Woburn, and now in excellent repair, having a very fine, though inconsistent, chancel ceiling, the work of Sir William Chambers, and to have been handsomely ornamented by Mr. Blore, at considerable expense, for the present Duke of Bedford's grandfather. It seems, however, by the *Bedford Times*, that the inhabitants, with a very few exceptions, strongly regret the change, being much attached to the old church, and finding it ample for the existing population; and it is thought that the Duke, absent from indisposition, but known not to have originated the scheme, may direct its reversal.

THE NEW BOOKS OF 1863.—According to the *Publishers' Circular*, 3,878 is the number of titles of publications issued in the past year. This falls in a trifling degree short of the number in 1862, which amounted, after similar deductions, to exactly 3,913. These figures, however, though interesting in some respects, afford really little indication of the relative prosperity of the trade in different years. Of course, if the number of titles of new works fell greatly in any particular year, it could not but indicate some real depression. But the true index of prosperity does not lie in the number of titles, which remain pretty nearly stationary from year to year, but in that far less easily ascertainable indication, the number of issues.

THE BARTLOW TUMULI.—Mr. Purnell, the secretary of the Archæological Institute, lately submitted to the members a profile of the Bartlow tumuli, prepared for them by the engineer of the Great Eastern railway, in order to show the manner in which he proposes to bring a new line between these interesting relics. At the same meeting a communication from the Society of Antiquaries was received. That body promised, by resolution, to offer strenuous opposition to the passage through Parliament of any Bill that shall give power to the Great Eastern Railway Company to injure the Bartlow gravemounds. Several members of the Institute having condemned the wanton and daily increasing disregard of public opinion shown by railway companies, it was unanimously resolved,—"That the proposed method of carrying a line of railway through the Bartlow hills is objectionable, and that no scheme would obtain the sanction of the Institute the adoption of which would in any degree injure or deface these singular monuments of antiquity."

THE GUERNSEY STONE TRADE AND THE THAMES EMBANKMENT.—A large contract has been taken for the supply of Guernsey Syenite for the Thames embankment. Professor Tennant, of King's College, has certified that the rock is composed of quartz, felspar, hornblende, and mica, very hard and compact, and one of the best stones that could be selected for the purpose, being less likely to perish than granite. A hundred thousand tons, much of it dressed, have been ordered. The specimen sent to London was taken from the Ville Baudu Quarry, belonging to Mr. James Monfries. The first stone for the undertaking has been worked.——A quantity of stone, amounting to 40,000 tons, has been prepared by the workmen employed by the contractors for the Alderney breakwater. This large quantity was intended for the eastern arm, which has not yet been commenced; but preliminary inquiries have been made with a view to having it transferred to Chatham Dockyard.——There is a strike among the stone-crackers at St. Sampson for an increase of 2d. per ton. Some of the men who are natives of the island wished to continue at the rates given at present, but were intimidated by the Irish portion of the labourers who were on strike.

THE INTERNATONAL EXHIBITION BUILDING.—The upper part of the eastern dome has been taken down, and the work of removal is going on.

ARCHITECTURAL INSTITUTE OF SCOTLAND.—At the meeting of the Architectural Institute of Scotland, to be held on the evening of Monday, the 1st of February, the business will be a letter from the hon. sec of the Architectural Alliance in reference to competitions; and a paper on—"A National Memorial—what it should be?"

THE LATE MR. PATRICK BYRNE, ARCHITECT.—Mr. Byrne, who died on the 10th inst., at the age of eighty-one, has erected a considerable number of churches in Dublin and its neighbourhood, besides buildings of a secular character. He was one of the vice-presidents of the new Institute of Architects of Ireland, and a member of the Hibernian Academy.

MONUMENTAL.—The *Englishman*, of India, states, that Mr. Burne has gone to Dhurrumsala, to complete the monument there being erected over the last resting-place of the late Lord Elgin. The design for this monument was chosen by Lord Elgin himself, during his dying hours, from designs drawn, at his own request, by Mr. Gordon, of Umritsur, civil engineer.— It is proposed to erect a statue to Bernard Palissy, the famous worker in pottery, at Saintes (Charente Inférieure), his birthplace.

EXTIRPATION OF INSECTS.—A correspondent asks for the best remedy for the destruction of insects of a very small size, which infest his kitchen, in the vicinity of Bryanston-square. Perhaps some of our readers may now be able to tell us of their experience with those insect powders of the pyrethrum class, a trial of which we suggested. Keating's insect powder is, we believe, of this class, and has been found effectual in killing some sorts of insects.

CASSELLI'S "PANTELEGRAM."—Some interesting and successful experiments have recently been made between the Liverpool and London stations of the Electric Telegraph Company with the telegraphic apparatus invented by M. Casselli, and termed the "Pantelegram." M. Casselli's principle is the transmitting to distant stations of *fac simile* copies of messages and signatures as written by the sender, and also exact counterparts of designs and portraits.

THE CHATHAM SURVEYORSHIP.—Mr. Weeden, the surveyor to the Local Board of Health, has recently died. The deceased gentleman held this office for a great number of years. The salary of Mr. Weeden, as surveyor and inspector of nuisances, was only 120*l.* The local board have ordered candidates for the office to be advertised for in the *Chatham News*, the election to take place this Friday, after rejecting attempts to reduce the salary to 100*l.*, with a foreman at 28*l.*, and even to 80*l.*, and an assistant at 60*l.*

THE GREAT NORTHERN HOSPITAL.—The Metropolitan Railway Company having carried their line immediately under this hospital, the committee have found another site and building in the Caledonian-road, midway betwixt King's-cross and the Cattle-market, and in the immediate vicinity of large manufactories and building yards, as well as the dwellings of the poor. A correspondent wishes us to urge the claims of this very useful institution on the public patronage, and this we most willingly do. The district contains a population of at least 500,000, heretofore without any hospital accommodation; and it is to be earnestly hoped that ere long it will be furnished with an hospital adequate to its wants. Subscriptions are received by the secretary at the present hospital, 235, Caledonian-road.

GLASGOW ARCHITECTURAL SOCIETY.—The usual monthly meeting was held in the rooms of the society on the 18th instant, Mr. J. Honeyman, jun., vice-president, in the chair. The chairman intimated that the fitting up of the rooms was now completed; the books had been arranged and catalogued, and arrangements had been made for lending them out to members. Mr. Campbell Douglas then read a paper entitled "Some Remarks on Fergusson's 'History of the Modern Styles of Architecture.'" After reviewing Mr. Fergusson's opinion that Italian is the *vernacular* of this country, Mr. Douglas showed that the old styles were all the products of ages of faith; that now-a-days men will not be confined to one style any more than to one faith; that when we all believe in common we shall have a new style; and when we have one faith we may hope for one style of architecture. He denied that a revived Italian was our vernacular.

BRIGHTON WEST PIER.—We perceive, by the first report of the Brighton West Pier Company, that "the contract for the erection of the pier has been let to Messrs. Laidlaw & Sons, of Glasgow, for the sum of 21,890*l.*"

THE FAIRBAIRN ENGINEERING COMPANY.—The large machinery and iron business of Messrs. Fairbairn & Co., of Manchester, is about to be merged into a joint-stock establishment, to be called the Fairbairn Engineering Company, with a capital of 250,000*l.*, in shares of 10*l.*, of which the chairman, Mr. Thomas Fairbairn, the sole representative of the old firm, subscribes for 70,000*l.*

THE ENGINEER TO THE LIVERPOOL DOCKS AND HARBOUR BOARD.—It has been agreed, in consideration of the services of Mr. Lyster, the engineer, to increase his salary to 2,500*l.* per annum, to commence from the 7th of November last, the end of the second year of his service. The Works Committee testified as to the zeal, diligence, and talent which Mr. Lyster had displayed in his department, and recommended the increase of salary thus given by the Board.

THE METROPOLITAN MAIN DRAINAGE PUMPING ENGINES.—The pumping engines for the Main Drainage works at Crossness, are now being constructed by Messrs. Boulton & Watt, at the Soho Works. These pumps will consist of an arrangement of four steam cylinders and eight pumps, fixed in an engine-house of large size. The four cylinders, each 48 feet in diameter by 9 feet stroke, will stand at the corners of a square. The pumps, eight in number, will each be 12 feet in diameter, and consist of a suction, middle, and delivery piece. Each steam cylinder will work eight plungers, the four nearest to the centre having a stroke of 2 feet 3 inches, and the other four a stroke of 4 feet 6 inches. They are all 57 inches in diameter. The suction valves will be vertical, the lower or suction pieces being cast like a circular open grate, 12 feet in diameter, the openings, some thirty in number, affording ample waterway. The delivery-valves will be the same in principle. The exact height of the lift will be about 18 feet. The boilers will be twelve in number, each 30 feet long by 6 feet in diameter.

SANITARY STATE OF NOTTINGHAM.—The report of the Sanitary Committee of the town of Nottingham for the year ending in September last has been printed. From this report it appears that the mortality at Nottingham, as elsewhere, has been high during the past year, but the increase has not brought the rate of mortality beyond 23 deaths to 1,000 living persons. The rate of infant mortality is still very unsatisfactory, seven-sixteenths of the whole number of deaths being of children under five years of age. The excess of 134 deaths this year over the last arises chiefly from the increase of 42 deaths under 5 years and 60 above 70 years of age upon the previous year. The report concludes with the remark that sanitary reform outside dwellings is progressing, but that such a reform interiorly, as regards ventilation and house-drainage, cleanliness, and general attention to the laws of health, is pressingly needful. The main outfall sewer for the drainage of the town, we may here add, is on the eve of completion, according to the local *Guardian*.

THALLIUM KNOWN TO THE ANCIENT MEXICANS.—It is reported upon good authority, says the *Mining Journal*, that a distinguished German chemist has just made an important discovery in connexion with the alloy now generally designated thallium. It appears that among the most ancient records of the ancient Mexicans an account is given of the mode of preparing the alloy used for producing the brilliant green fire which was freely burnt during the sacrificial ceremonies in honour of Vitzipultzi, one of their principal deities; and that in the attempt to prepare a similar alloy, from the details given, a discovery opening up an entirely new field of chemical science has been made. By the peculiar treatment of certain proportions of silver, lead, and selenium, a black powder was produced, so much resembling that designated thallium that the experimenter was induced to test it. The weight of alloy was precisely equal to that of the metals used; yet the whole of the reactions of thallium were obtained, and salts, bases, and acids of the alloy were produced, precisely as if the alloy had been a perfect metal. Even in the spectroscope the well-known green line was produced. It is anticipated that some tons of thallium will shortly be ready for sale in England at less than the price of silver.

DESTRUCTION OF A CHURCH BY FIRE.—St. Ann's Church, in the village of Parr, near St. Helen's, has been destroyed by fire. The damage is roughly estimated at about 1,000*l.*, and the building was not insured. The fire originated through the overheating of the flues, as usual, in airing and preparing the church for divine service.

ATMOSPHERIC PRESSURE AS A REMEDIAL AGENT. At a scientific meeting in Paris, a singular paper was lately read by Dr. Foley, in which the writer recommends a high atmospheric pressure as a cure for various diseases. This can be done by constructing a small chamber communicating with a forcing-pump, and provided with an air-gauge and safety-valve. By this treatment catarrh, asthma, and complaints of the respiratory organs, it is said, may be removed; and in disorders arising from weakness, compressed air will arterialise the blood, and increase the vital power of the patient.

THE NIAGARA OUTRIVALLED.—A detachment of troops recently scouting in the valley of the Snake or Lewis fork of the Columbia, discovered a waterfall which, it is said, is entitled to the distinction of being called the greatest in the world. The entire volume of Snake river pours over a sheer precipice 198 feet high, 38 feet higher than Niagara. Snake river is fully as large as the Niagara, and the cascade is one solid sheet or body. The locality of this immense waterfall is near the point heretofore designated as the Great Shoshone or salmon falls of that river, but they have always been enveloped in mystery.

THE BIRMINGHAM SOCIETY OF ARTISTS.—The annual exhibition of this society has been a good one. The sales for the season of 1862-3 were;—General sales, 1,516*l.* 16s.: this amount includes 500*l.* of purchases made by the Art-Union of Great Britain; while the purchases of the Birmingham Art-Union amounted to 1,009*l.* 16s.; or total sales, 2,525*l.* 12s. In the last season, 1863-4, the general sales amounted to 1,450*l.* 11s., and the Birmingham Art-Union purchases to 950*l.* 7s.; making a total of 2,400*l.* 18s. Deducting 500*l.* spent by the National Art-Union in 1862, the sales of the present season compare advantageously with those of the season preceding. The number of persons who during the four weeks of cheap admission visited the exhibition was 11,760; while an additional 6,500 availed themselves of the free admissions given to all purchasers of Art-Union tickets. Thus, in one month, 18,260 persons—mostly of the working class—visited the exhibition.

LONDON, BRIGHTON, AND SOUTH COAST RAILWAY.—The half-yearly report of the directors has been published. The amount of capital raised on the 31st of December, 1863, was 11,708,974*l.* The amount of capital expended during the half-year was 625,580*l.* The gross revenue has been 537,160*l.*, showing a diminution of 43,401*l.*, when compared with the corresponding half-year. The directors, in announcing so large a reduction, state that it was hardly unexpected, inasmuch as the comparison is with the exceptional period of the International Exhibition of 1862. Besides this, it is to be attributed, to a considerable extent, to the great reduction of fares, which took place on the 1st of August last; whilst, considering the short period during which it has been in force, that reduction could not be compensated for by the augmentation which experience proves to have always followed diminution of charges, and of which the realisation must not be expected until time has been given to produce this unfailing result. The directors, however, remain of opinion that the policy which they adopted will ultimately be productive of benefit to the company. The balance available for dividend is also much diminished by a further heavy debt (21,632*l.*) for compensations in respect of accidents not occurring during the past half-year. The works on the South London line are making rapid progress; and by the end of the year 1864 it is hoped that these, as well as the widening of the Greenwich viaduct, and the necessary enlargement of the London Bridge Station, will be ready for traffic. Bills have been introduced seeking for powers to enable the company to complete the northern link of the Streatham, Mitcham, and Sutton line of last year; to carry out the arrangements concluded with the London, Chatham, and Dover Railway Company, as regards the access to Victoria Station; to extend the New Croydon line into the town of Croydon; and for other minor matters.

DECORATION OF ST. PAUL'S.—The work of carrying out the adornment of the interior of St. Paul's Cathedral lags for want of funds. It is estimated that 40,000*l.* at least are required for the completion of the work. This sum, it is proposed, should be raised mainly by a guinea subscription, to which the whole nation shall be asked to contribute. A resolution to this effect was carried at a meeting at the Mansion House, yesterday, and a committee was appointed to carry it out.

TENDERS.

For forming fair ground at Reading, Berks. Mr. W. H. Woodman, borough surveyor:—

Orton	£2,897 0 0
Adams & Kirby	2,702 0 0
Hartland & Bloomfield	2,388 0 0
Shaw	2,277 10 0
Rentmore	2,119 0 0
Hawkes (accepted)	1,987 12 0
Oliver (not opened: delivered after time).	

For restoration of Letcombe Regis Church. Mr. W. H. Woodman, architect.

Kent (accepted)	£6,980 0 0

For completing the Paxton Arms, Wimbledon, for Mr. W. F. Hodgson, Kingston. Messrs. Wimble & Taylor, architects:—

Adamson & Son (accepted)	£1,955 0 0

For the first block of granaries, engine and boiler houses, and chimney-stalk, for the Patent Ventilating Granary Company, Rotherhithe. Mr. James Edmeston, architect. Quantities supplied by Mr Parr.

Lawrence & Sons	£16,273 0 0
Mansfield	16,200 0 0
Holland & Hannen	15,835 0 0
Myers & Sons	15,825 0 0

TWISDEN'S MECHANICS.—CHEAPER EDITION.
Just published, in crown 8vo. price 10s. 6d. cloth.
ELEMENTARY INTRODUCTION to PRACTICAL MECHANICS, Illustrated by Numerous Examples. Being the Second Edition, thoroughly revised, of "Elementary Examples in Practical Mechanics."
By the Rev. JOHN F. TWISDEN, M.A. Professor of Mathematics in the Staff College.
London: LONGMAN, GREEN, & CO. Paternoster-row.

NEW AND CHEAPER EDITION OF MRS. JAMESON'S MONASTIC LEGENDS.
The Third Edition, corrected, in square crown 8vo. with 11 Etchings by the Author, and 88 Woodcuts, price 21s. cloth,
LEGENDS of the MONASTIC ORDERS, as represented in the Fine Arts: comprising the Benedictines and Augustines and Orders derived from their Rules, the Mendicant Orders, the Jesuits, and the Order of the Visitation of St. Mary.
By Mrs. JAMESON.
Also by Mrs. JAMESON, in the same Series,
LEGENDS of the SAINTS and MARTYRS. Fourth Edition, carefully revised; with 17 Etchings and 180 Woodcuts. 2 vols. 31s. 6d.
LEGENDS of the MADONNA. Third Edition, corrected and enlarged; 27 Etchings and 165 Woodcuts. 2 vols. price 28s.
London: LONGMAN, GREEN, & CO. Paternoster-row.

THE ARTISAN CLUB'S TREATISE ON THE STEAM ENGINE.
In One Volume, quarto, with 37 Plates and 546 Engravings on Wood (later new in this Edition), price 42s. cloth,
A TREATISE on the STEAM-ENGINE, in its various Applications to Mines, Mills, Steam Navigation, Railways, and Agriculture; with Theoretical Investigations respecting the Motive Power of Heat and the Proportions of Steam-Engines; Tables of the right Dimensions of every Part; and Practical Instructions for the Manufacture and Management of every species of Engine in actual use.
By JOHN BOURNE, C.E. Fifth Edition.
New Edition, with 89 Woodcuts, in fcp. 8vo. price 6s.
BOURNE'S CATECHISM of the STEAM-ENGINE.
London: LONGMAN, GREEN, & CO. Paternoster-row.

Fcap. 8vo. cloth, 3s. 6d.
A CLUE to RAILWAY COMPENSATION, the VALUE of ESTATES, and PAROCHIAL ASSESSMENT.
By THOMAS MORRIS.
"We have no doubt this clever little Work will have a great sale—it well deserves such."—*Estate Gazette.*
SIMPKIN, MARSHALL, & CO. Stationers' Hall-court, E.C.

Dedicated, by permission, to the Right Hon. Lord Palmerston.
DESIGNS for MONUMENTS, TOMBS, GRAVESTONES, &c. price 16s. complete in one volume.
By JOSEPH H. ROBINSON, Sculptor, Derby.
The designs in this volume are suitable for either cemetery or churchyard. The book forwarded free to any part of the kingdom for post-office order

Just published. Forty-fourth Edition, price 4s. bound in cloth,
LAXTON'S PRICE BOOK for 1864, for ARCHITECTS, ENGINEERS, BUILDERS, CONTRACTORS, SURVEYORS, &c. (established 1816), containing more than 50,000 prices, together with 10,000 useful and important Memoranda, &c. &c. The reputation which this book has gained as a book of reference in general use by the professions and trades connected with Building, Engineering, and Contracting, and the great increase in its circulation, are proofs that the efforts to render it as useful as possible have been recognised. To the present Edition a large amount of entirely new matter has been added, as will be seen on comparing it with the last Edition.
This work is not printed from stereotype plates: errors are, therefore, readily corrected in every reprint; and in each succeeding edition such alterations and additions are made as will be found practically useful to the Architect, the Engineer, and the Operative.
London: SIMPKIN, MARSHALL, & CO. Stationers' Hall-court.
Supplied by all Booksellers.

"Mr. Murray's excellent and uniform series."—*English Churchman.*
"Mr. Murray's Student's Manuals are the cheapest educational books in existence."—*Examiner.*

MR. MURRAY'S STUDENT'S MANUALS
FOR ADVANCED SCHOLARS.

"This series of 'STUDENTS' MANUALS,' edited for the most part by Dr. WM. SMITH, possess several distinctive features which render them singularly valuable as educational works. While there is an utter absence of flippancy in them, there is thought in every page, which cannot fail to excite thought in those who study them, and we are glad of an opportunity of directing the attention of such teachers as are not familiar with them to these admirable school-books."—*The Museum.*

I.—ENGLAND.
THE STUDENT'S HUME: a History of England from the Earliest Times. Based on the History by DAVID HUME, corrected and continued to 1858. Woodcuts. Post 8vo. 7s. 6d.
"This History is certainly well done. In the form of Notes and Illustrations, many important subjects, constitutional, legal, or social, are treated; and the authorities of the period are mentioned at its close."—*Spectator.*

II.—FRANCE.
THE STUDENT'S HISTORY of FRANCE. From the Earliest Times to the Establishment of the Second Empire, 1852. Edited by WM. SMITH, LL.D. Woodcuts. Post 8vo. 7s. 6d.
"There was no greater literary want than a really good English History of France, which is now supplied by the work before us. The matter is well selected, and well condensed; and the style is clear and forcible."—*Gardener's Chronicle.*

III.—GREECE.
THE STUDENT'S HISTORY of GREECE. From the Earliest Times to the Roman Conquest. By WM. SMITH, LL.D. Woodcuts. Post 8vo. 7s. 6d.
"Written on an excellent plan, and carried out in a careful and scholar like manner. The great distinctive feature, however, is the History of Literature and Art. This gives it a decided advantage over all previous works."—*Athenæum.*

IV.—ROME.
(1) THE REPUBLIC.
THE STUDENT'S HISTORY of ROME. From the Earliest Times to the Establishment of the Empire. By DEAN LIDDELL. Woodcuts. Post 8vo. 7s. 6d.
"We should commend this History to the youthful student as the one which will convey the latest views and the most extensive information. Our opinion is, that there is no other work which so ably supplies 'a History of Rome' suited to the present day."—*Blackwood.*

(2) THE EMPIRE.
THE STUDENT'S GIBBON: an Epitome of the History of the Decline and Fall of the Roman Empire. By WM. SMITH, LL.D. Woodcuts. Post 8vo. 7s. 6d.
"Dr. Wm. Smith has preserved the main features of the great historian's work, the chief alterations being the omission of offensive anti-Christian sneers, and the incorporation of important notes in the body of the text."—*Guardian.*

V.—LANGUAGE and LITERATURE.
THE STUDENT'S MANUAL of the ENGLISH LANGUAGE. By GEORGE P. MARSH. Edited, with additional Chapters and Notes, by WM. SMITH, LL.D. Post 8vo. 7s. 6d.
"Dr. Smith has added two chapters, containing a compact yet distinct summary of what is to be found in the best writers on the English language; and has produced a manual of great utility."—*Athenæum.*

THE STUDENT'S MANUAL of ENGLISH LITERATURE. By T. B. SHAW. Edited, with Notes and Illustrations, by WM. SMITH, LL.D. Post 8vo. 7s. 6d.
"Mr. Shaw has supplied a desideratum in English Literature. His book contains a brief but satisfactory sketch of all the great English writers, from the earliest period to the present day. On the whole it appears to be a fair and impartial summary."—*English Review.*

VI.—GRAMMARS.
THE STUDENT'S GREEK GRAMMAR. By PROFESSOR CURTIUS. Translated under the Revision of the Author. Edited by WM. SMITH, LL.D. Post 8vo. 7s. 6d.
"There is no Greek Grammar in existence which in so small a compass contains so much valuable and suggestive information, and we hope that it may ere long be adopted as the standard Greek Grammar in this country, a position which it holds in most of the schools of continental Europe." —*The Museum.*

THE STUDENT'S LATIN GRAMMAR. By WM. SMITH, LL.D. Post 8vo. 7s. 6d.
"This grammar is intended to occupy an intermediate position between the large treatises of Zumpt and Madvig, and the numerous elementary school grammars. There are few students who will require more information than is here supplied by skilful arrangement, in a convenient size and form for practical use. The editor's good sense is visible throughout."—*Athenæum.*

VII. GEOGRAPHY.
THE STUDENT'S MANUAL of ANCIENT GEOGRAPHY. By REV. W. L. BEVAN. Edited by WM. SMITH, LL.D. Woodcuts. Post 8vo. 7s. 6d.
"A valuable addition to our general libral works. It contains the newest and most reliable information derived from the researches of modern travellers. No better text book can be placed in the hands of scholars."—*Journal of Education.*

JOHN MURRAY, Albemarle-street.

Price 2s. 6d. bound in cloth,
TABLES for TIMBER-MERCHANTS and BUILDERS.
By WM. RICHARDSON, Author of "The Calculator; or, Timber-merchant's and Builder's Guide."
Manchester: 56 and 58, Oldham-street.
London: SIMPKIN, MARSHALL, & CO.

THE ART JOURNAL (price 2s. 6d. monthly), The February Number contains the following Line Engravings:—"Purity," by H. Bourne, after H. O'Neil, A.R.A.; "The Battle of Trafalgar," by W. Miller, after J. M. W. Turner, R.A. in the Hall of Greenwich Hospital; "The Reading Girl," by W. Roffe, from the Statue by P. Magni. The literary contributions include:—"Cyclopean Architecture in the Ionian Islands," by Professor Anster, illustrated; "Dante's 'L'Inferno,'" illustrated; "On the Preservation of Pictures painted in Oil Colours," by J. B. Pyne; "The Arundel Society;" "Mr. J. D. Harding: a Biography;" "British Artists: their Style and Character," by J. Dafforne, illustrated; "Almanac of the Month," from Designs by W. Harvey, illustrated; "Art-Work in February," by the Rev. J. G. Wood, M.A.; "Portrait Painting in England," by Peter Cunningham, F.S.A.; "The Scottish School of Art;" "Gold Casket presented to H.R.H. the Prince of Wales," illustrated; "The 'Casket' Portrait;" "Sacred Poetry," illustrated; "Robinson Crusoe," illustrated; "Thorwaldsen's Sculptures;" "History of Caricature and of Grotesque in Art," by T. Wright, M.A. F.S.A. illustrated; "Jerusalem and the Holy Land;" "Another Blow for Life;" "Aluminium Bronze;" "Sir Stafford Northcote on Schools of Art," &c. &c.
London: JAMES S. VIRTUE, 26, Ivy-lane.

TO ARCHITECTS, SURVEYORS, BUILDERS, AND OTHERS.
AN ARCHITECT and SURVEYOR, with available assistance, prepares designs, details, perspectives, specifications, valuations of houses, dilapidations, &c. on moderate terms.—Address, ARCHITECT, Office of "The Builder."

GAS and GENERAL ENGINEERING OFFICES, 1, HANOVER-STREET, EDINBURGH (opposite the Royal Institution of Arts). Mr. JOHN ROMANS, Practical and Civil Engineer, may be consulted at the above address on all matters pertaining to gas-works, water-works, and other engineering questions.—Plans and specifications furnished, works erected and repaired, or taken on lease for a term of years.—Orders received for Scottish Cannel Coal and Fire-clay goods.

PERSPECTIVES, GEOMETRICAL and other DRAWINGS made by the Advertiser, from rough sketches or otherwise.—Address, C. 70, Camberwell New-road, S. and 17, Hill-street, S.W.

TO ASSISTANTS.
A LONDON ARCHITECT requires the immediate SERVICES of an efficient ASSISTANT, who can get out from rough sketches) geometrically and perspective drawings. State previous engagements, age and salary required.—Apply by letter, to B. 22, Henrietta-street, Covent Garden, W.C.

BOROUGH of BURNLEY. — To SURVEYORS.—WANTED, immediately, an ASSISTANT in the BOROUGH SURVEYOR'S OFFICE, for a probable period of twelve months. Salary, 2l. per week. The applicant must be a quick and efficient draughtsman, possessing a thorough knowledge of levelling and surveying. Applications and testimonials to be forwarded on or before the 6th day of FEBRUARY next, addressed to Mr. W. H. COLBRAN, Borough Surveyor, Burnley, Lancashire.

BIRKENHEAD CEMETERY.—The Birkenhead Improvement Commissioners, as the Burial Board for their district, are prepared to receive APPLICATIONS for the APPOINTMENT of the REGISTRAR and SUPERINTENDENT of the New Cemetery. Persons applying must, in addition to the duties of Registrar, be competent to take the general management of the Cemetery, with the buildings, plantations, and shrubberies, and also to correctly set out the graves as they agree with the Cemetery plans. Salary 150l. per annum, with a residence. The engagement to be terminable on three months' notice from either side. Applications, stating age and whether married, and what family, together with testimonials, to be sent in on or before the 17th day of FEBRUARY next, addressed to the Chairman of the Cemetery Committee, Commissioners' Offices, Birkenhead.—By order,
AMBROSE WALN, Clerk to the Commissioners.
Commissioners' Offices, Birkenhead, 21st Jan. 1864.

CLERK WANTED, who can assist in estimates, correspondence, and book-keeping, and has had considerable experience in a Builder's Office—Apply, by letter only, stating age and salary required, to Messrs. COX & SON, Church Furniture Manufacturers, Southampton-street, Strand, London.

LAVENHAM HIGHWAY DISTRICT, SUFFOLK.—A MEETING of the Board of the above District will be held at the Lion Inn, Lavenham, on TUESDAY, the 16th day of FEBRUARY next, at ELEVEN o'clock in the forenoon, prepared to receive sealed APPLICATIONS, with testimonials, from Persons willing to become CANDIDATES for the offices of DISTRICT SURVEYOR, at a salary of 200l. per annum, and ASSISTANT SURVEYOR, at a salary of 100l. per annum. Candidates to appear in person. No travelling or other expenses allowed. The district consists of fifty-five parishes, about 420 miles, and 106,550 acres. The persons elected to the above offices will be required to reside in the district, and devote their whole time to the duties of their respective offices, and commence such duties on the 25th of MARCH next, and to provide surety satisfactory to the Board. By order of the Board,
RICH. NEWMAN, Clerk.
Lavenham, January 14, 1864.

TO ARCHITECTS AND SURVEYORS OR ENGINEERS.
REQUIRED, a competent ASSISTANT; one preferred having experience in railway compensations.—All particulars to H. P. Office of "The Builder."

TO SURVEYORS and VALUERS.—The Poor-Law Board having issued their warrant for a valuation of the rateable property within the Parish of Newchurch, in the Isle of Wight, the Churchwardens and Overseers of that parish are ready to receive offers from persons willing to make such valuation. The party who may be appointed will be required to attend at his own expense, on all appeal against the valuation, during the twelve months next after the delivery of the valuation, and to make any new valuation consequent on such appeal, without any further charge to the Parish. The charges for the valuation will be paid by twenty quarterly instalments, commencing from the delivery of the valuation. Persons willing to UNDERTAKE the VALUATION are requested to state the amount of charge for the same and to forward particulars of competency by letter, addressed to the Churchwardens and Overseers of Newchurch, Ryde, Isle of Wight, on or before the 3rd day of FEBRUARY next. The parish comprises the towns of Ryde and Ventnor, and a large agricultural district.—For the Parish Officers,
JAMES DASHWOOD, Churchwarden.
Ryde, 13th January, 1864.

TO ENGINEERS.—The Guardians of the Poor of the City of Bristol intend to APPOINT an ENGINEER for their WORKHOUSE, at Stapleton, near Bristol. Salary 60l. per year, with board, lodging, and washing in the Workhouse. The duties of the Engineer will comprise the care and management of two large steam-boilers, and of the warm and cold water and steam supply. He must have a knowledge of plumbers' work, and will be required to do all the ordinary repairs wanting to the pumps, boilers, cisterns, cooking vessels, gas, water, and steam apparatus, pipes, cocks, and fittings, and all other ordinary repairs in the department of an Engineer and Smith throughout the House; and to perform generally any duties which may be assigned to him conformable to the nature of his office. He will be required to devote his whole time to his duties, and to pay strict obedience to the regulations of the Poor Law Board, and the directions of the Guardians.—Applications, with Testimonials, are to be sent to St. Peter's Hospital, Bristol, on or before SATURDAY, the 6th of FEBRUARY next; and the same will be considered by the Guardians at their meeting on FRIDAY, the 12th FEBRUARY next. Preference will be given to a person possessed of knowledge and experience in the manufacture of Gas Works.—By order of the Board,
W. D. WILMOT, Clerk.
22nd January, 1864.

TO ARCHITECTS.—There is a good opening in a rising Colony for a well-qualified Architect. His first work there would be to SUPERINTEND the ERECTION of a CHURCH, from designs already furnished by Mr. G. G. Scott. The terms of his remuneration for the service will be arranged in England, and it will serve as an introduction to general practice in his profession. Any gentleman desirous of entering can obtain further particulars upon written application, stating his age, antecedents, references, and the works with which he has been connected, &c. addressed to R. S. SELFE, Esq., 15, St. George's-square, S.W.

WANTED, a well-qualified ASSISTANT, in an Architect and Surveyor's Office, in Liverpool, accustomed to the routine of office duty, and thoroughly able to prepare specifications, take out quantities, and measure off work; salary, 100 per month, with prospect of increase. An elegant assortment of Fine Gold Watch-coat and Guard Chains, from 3 to 25 Guineas. Gold and Silver Pocket CHRONOMETERS, Astronomical Regulators, Turret, Church, and Bracket Clocks of every description.

E. DENT & Co. 61, STRAND, W.C. (adjoining Coutts's Bank), and at 34 and 35, ROYAL EXCHANGE, E.C.; and also at the Turret Clock and Marine Compass Factory, SOMERSET WHARF, STRAND, LONDON, W.C.

TO BE LET, an old-established BUILDERS' BUSINESS, where a profitable trade has been done for many years, with immediate possession.—Apply to T. & T. NASH, Farnham, Surrey.

CHIPPENHAM, WILTS.—To STONE and MARBLE MASONS, CARVERS, SCULPTORS, DEALERS in MARBLES, GLAZED PIPES, FIRE BRICKS, CHIMNEY TOPS, &c. In consequence of the recent death of the late Mr. Samuel Benjamin King, who for several years has carried on a prosperous trade in the above business, in the thriving town of Chippenham and neighbourhood, his executors are desirous of DISPOSING of the same. The Trade is in full work, and might be extended by an active and competent man of business. The rent of the house and premises is 32l. per annum. The stock to be taken at a valuation. A capital of about 400l. would be required. The premises are well situated in the New Road, near the Great Western Railway Station.—For further particulars, apply to Mr. JOHN MAYO, one of the Executors; or to Messrs. PINNIGER & AWDRY, Solicitors, Chippenham.

TO BUILDERS.—TO BE SOLD, with immediate possession, owing to the illness of the proprietor, the LEASE (nearly fifty years unexpired), and GOODWILL of extensive PREMISES, in a county town: consisting of dwelling-house, counting house, mason, plumber, smith, and joiner's shops, sawing shed, with steam machinery, nearly new; drying-room, store-room, stabling, sheds, yard, any every requisite for business purposes. The business of a builder has been successfully carried on by the proprietor on the premises, for the last thirteen years, and now is in a flourishing position. The above will be disposed of either with or without the stock-in-trade, as a purchaser may desire. To a man of business habits this presents an opportunity rarely to be met with of stepping into a first-class business, on unusually easy terms.—For price and particulars, inquire of Messrs. MAULE & BURTON, Solicitors, Huntingdon.—January 27, 1864.

TO BUILDERS AND HOUSE DECORATORS. WANTED, a JOBBING BUSINESS, in a good neighbourhood in London or the suburbs: (by) letter to S. R. Office of "The Builder," stating terms and full particulars.

TO MACHINISTS, SMITHS, &c.—For DISPOSAL, by order of the Mortgagee, the LEASE, Engine, Lathes, Forges, Tools, some Furniture, &c. of an old-established BUSINESS. Price for all, 175l.; accommodation for part, if required. Apply to Messrs. WYMER & CO. 203, Gray's Inn-road, opposite Cubitt's.

FOR SALE.—An established BUILDING BUSINESS, turning 4,000l. a year. Capital House, Premises, and Workshops, &c. on Lease. Some excellent lots of seasoned and dry Oak, Ash Mahogany, and Pitch Pine. Several pieces of beautifully carved ancient oak furniture.—Apply, ED. JEBOULT, Taunton.

TO BE DISPOSED OF, a small old-established CARPENTER'S BUSINESS, with House and Garden, Sheds, and Timber yard, let at 11l. per year, attached. Incoming, about 70l. A first class opening for a persevering young man. Apply to R. PEDDIT, Rockhurst Green, Hurst Green, Sussex.

BRICKMAKING, BY STEAM OR HORSE POWER,

BUNNETT'S PATENT
CONTINUOUS FEED MACHINES
Are the cheapest and most efficient, and will make from 5,000 to 20,000 bricks per day, according to the power applied and the requirements of the proprietor, at one-third less working expenses than any other.
Price 75l. including royalty, and a gun-metal die for Solid, and Perforated or Hollow Bricks.
They also make all kinds of Sanitary Pipes, Tiles, or Moulded Bricks, of a superior quality.
LICENCES GRANTED TO MANUFACTURERS.
For particulars apply to BUNNETT & CO. Engineers, Deptford, Kent, where the Machines may be seen at work.

TO BRICKMAKERS.—All Parties who BURN BRICKS in CLAMPS are invited to inspect the NEW MODE of SETTING, patented by Mr. ROBERT WHITE, and which may be seen in operation at the Brickfields of
J. B. WHITE & BROTHERS, Erith, Kent.
The advantages of this plan are two-fold.
1st. Nearly all the bricks are burnt into stocks, and the yield of inferior bricks is reduced from 35 to about 10 per cent of the total make, which in itself represents a large permanent saving.
2nd The bricks are so much improved in colour and soundness as to give them a considerable additional value in the market over common stocks
Licenses for use of the Patent granted to Brickmakers, on application to the Patentees, 17, Millbank-street, Westminster.
